WARRANTY

WARRANTY to **Transbay Joint Powers Authority**
(Owner Name)
201 Mission, Suite 2100, San Francisco, CA
(Owner Address)

We hereby warrant and guarantee that the _____
(Description of Work)

which we have installed at Transbay Transit Center has been done in strict accordance with the plans and specifications, and that the work installed will fulfill the requirements of those specifications.

We agree to repair or replace, or cause to be repaired or replaced, any or all of the work which may prove to be defective in workmanship or materials, together with any adjacent work which required repair or replacement because of our defective work within a period of _____ year(s) from the filing of the Notice of Completion on all improvements, or acceptance by the Owner of the building, whichever is later.

If we fail to commence to comply with the above paragraph within ten (10) days after receipt of written notice, or fail to pursue such compliance with diligence, we jointly, and severally, do hereby authorize the Owner or the General Contractor to proceed to have the defects repaired and made good at our sole expense, and we will honor and pay the costs and charges for it together with interest at the maximum rate permitted by law upon demand. If we fail to fulfill the preceding obligations, and if Owner or General Contractor bring an action to enforce this Warranty, we agree to pay Owner or General Contractor reasonable attorney's fees incurred in connection therewith.

WAIVER OF OUR RIGHT TO RECOVER FROM OTHERS ENDORSEMENT

This endorsement changes the policy to which it is attached effective on the inception date of the policy unless a different date is indicated below.

(The following "attaching clause" needs to be completed only when this endorsement is issued subsequent to preparation of the policy.)

This endorsement forms a part of Policy No. XYZ 1234567

Issued to: ABC SUBCONTRACTOR

By: XYZ INSURANCE COMPANY

Premium (if any) TBD

We have a right to recover our payments from anyone liable for an injury covered by this policy. We will not enforce our right against the person or organization named in the Schedule. (This agreement applies only to the extent that you perform work under a written contract that requires you to obtain this agreement from us).

You must maintain payroll records accurately segregating the remuneration of your employees while engaged in the work described in the Schedule.

The additional premium for this endorsement shall be 2.5% of the California workers compensation premium otherwise due on such remuneration.

Schedule

Person or Organization	Job Description
WEBCOR/OBAYASHI JOINT VENTURE, Its Officers, Directors and Employees AND TRANSBAY JOINT POWERS AUTHORITY, its Board Members and Commissions, All Authorized Agents and Representatives, and Members, Directors, Officers, Trustees, Agents and Employees of Any of Them.	TRANSBAY TRANSITY CENTER BUILDING.

WAIVER OF SUBRAGATION FOR WORKERS COMPENSATION INSURANCE TO BE INCLUDED.

WC 04 03 06
(Ed. 4-84)

Countersigned by John Doe
Authorized Representative

POLICY NUMBER: XYZ 1234567 COMMERCIAL GENERAL LIABILITY

THIS ENDORSEMENT CHANGES THE POLICY. PLEASE READ IT CAREFULLY.

ADDITIONAL INSURED – OWNERS, LESSEES OR CONTRACTORS (FORM B)

This endorsement modifies insurance provide under the following:

COMMERCIAL GENERAL LIABILITY COVERAGE PART

SCHEDULE

Name of Person or Organization: WEBCOR/OBAYASHI JOINT VENTURE, Its Officers, Directors and Employees

AND

TRANSBAY JOINT POWERS AUTHORITY, its Board Members and Commissions, All Authorized Agents and Representatives, and Members, Directors, Officers, Trustees, Agents and Employees of Any of Them.

RE: TRANSBAY TRANSIT CENTER BUILDING.

(If no entry appears above, information required to complete this endorsement will be shown in the Declarations as applicable to this endorsement.)

WHO IS AN INSURED (Section II) is amended to include as an insured the person or organization shown in the Schedule, but only with respect to liability arising out of "your work" for that Insured by or for you.

If required by your agreement with such insured, this insurance shall be primary insurance for such Insured. If anyone also provides similar insurance for such Insured, then that insurance will be primary, and this insurance will be excess over, or secondary to that insurance.

"The insurance afforded by this policy for the additional insured(s) is primary insurance and any other insurance maintained by or available to the additional Insured(s) is non-contributory."

LEED Subcontractor Submission Letter and Data Sheet

March 13, 2014 Revision 3

WEBCOR/OBAYASHI JOINT VENTURE
SAN FRANCISCO, CA

EXHIBIT E

Exhibit E – LEED Trade Subcontractor Submission Letter & Data Sheet

Transbay Transit Center
Webcor/Obayashi Joint Venture
175 Beale Street
San Francisco, CA 94105
T 415-978-5700

To Whom It May Concern:

In our efforts to complete LEED Documentation for the **Transbay Transit Center Project** we will need the following information provided on your official company letter head:

1. Company Name & Contact Information

2. Contract Value

3. Progress Report Date

4. Scope of work included in Contract with specific Division and Sections listed.

5. **List of all materials permanently installed on the project**, within the LEED boundary that were included in the contract. A total estimated weight value and total actual material cost must be provided for each material. Please provide exact Material name & manufacturer, division and specification section number (XX XX XX).

6. Recycled content (**post-consumer and pre-consumer broken out separately**) percentages for each material from CSI Masterformat 2004 Edition Divisions 3-10, 31 (Section 31 6X XX Foundations) and 32 (Sections 32 1X XX Paving, 32 3X XX Site Improvements, 32 9X XX Planting). Please provide cut sheets of each material with the recycled content values posted.

7. List the location of material extraction (city, state, country) and material manufacturing (city, state, country) for all materials from CSI Masterformat 2004 Edition Divisions 3-10, 31 (Section 31 6X XX Foundations) and 32 (Sections 32 1X XX Paving, 32 3X XX Site Improvements, 32 9X XX Planting). Specifically, we are looking for those materials that were **both extracted and manufactured** within a weighted total travel distance of 500 miles of the jobsite. Per addendum to the BD+C v2009 Reference Guide, weighted total travel distance under Option 2 of the MR Credit 5 Regional Materials should be calculated using the following formula: (Distance by rail/3) + (Distance by inland waterway/2) + (Distance by sea/15) + (Distance by all other means) ≤ 500 miles [800 kilometers]. If you are sure that your materials do not comply as Regional Material, please note that the material was extracted/manufactured “greater than 500 miles” from the jobsite.

8. If you provided any adhesives, sealants, coatings, paints, carpet systems, etc. – please be sure to include these materials on your spreadsheet with the **actual VOC content (g/L**). Please provide proof in the form of a cutsheet, or MSDS highlighting the VOC content value.
    a. All particleboard, MDF, Agrifiber, Veneers, and composite wood products must be **Urea-Formaldehyde free**. Please note “*Urea-Formaldehyde free*” in the VOC column for these material types. All Agrifiber/composite wood products must provide proof of being Urea-formaldehyde free in the form of MSDS, Cut Sheet, or Letter from the Manufacturer.

9. For all materials that contain wood, please specific the FSC Wood **Chain of Custody number** (COC). The COC Certificate and **original purchasing invoices** must be provided as proof of purchase/certification.

LEED Submittals:

A. **Preliminary LEED Material Spreadsheet Submittal** - Within 30 days of Contract award, assemble and submit the "LEED Material Tracking Spreadsheet" complete with all data described in 4-8 above. Cover letter and back up documentation are not necessary for this submittal. The quantities, costs, products, and LEED metrics should be entered in the spreadsheet as the project/contract scope was bid/ estimated. Please see the sample LEED Material Tracking Spreadsheet that you must complete and submit back to Webcor/Obayashi Joint Venture within 30 days of awarded contract.

B. **Quarterly LEED Progress Reports (Reference 01 81 13 1.5 E 2)** – Quarterly LEED Progress Reports are due by February 10 (Q1), May 10 (Q2), August 10 (Q3), and November 10 (Q4) of each year. Assemble and submit the "LEED Material Tracking Spreadsheet" in, PDF and Excel formats, complete with all data described in 4-8 above and based on the Preliminary LEED Material Spreadsheet Submittal. All changes from the previous quarter shall be indicated in bold. Update each Material Status with one of the following: Preliminary, Approved, Bought, or Installed.
    a. Preliminary – Indicates the material has been included in its preliminary stage of planning but has yet to be approved by the design team.
    b. Approved – Indicates the material has been approved by the Design Team as meeting all requirements specified. Include Design Team submittal approval.
    c. Bought – Indicates the material has been bought out after approval by the Design Team.
    d. Installed – Indicates the material has been permanently installed on the project within the LEED boundary.

C. **Final Exhibit E Submittal** – Prior to closeout, assemble and submit all 'actual' LEED material information on the "LEED Material Tracking Spreadsheets" and forms provided in the Project Manual, together with all supplemental documentation as required by LEED. Please see the sample LEED cover letter and Material Tracking Spreadsheet that you must complete and submit back to Webcor/Obayashi Joint Venture prior to closeout on the project.

If you have any questions or concerns, please contact Webcor/Obayashi Joint Venture. If there is any information that you are not able to track down please let us know. We are here to support your LEED efforts.

Sincerely,

WEBCOR/OBAYASHI JOINT VENTURE

Webcor/Obayashi Joint Venture Statement on Safety

It is the policy of Webcor/Obayashi Joint Venture to provide employees a safe place to work. The personal safety and health of each employee of this company is of prime importance. The prevention of accidents and injury will be given precedence over operating productivity whenever necessary. To the greatest degree possible, management will provide facilities required for personal safety and health.

Our objective is a program that will reduce the number of injuries to a minimum and to surpass the best experience of other operations similar to ours. Our goal is zero accidents and injuries.

Our policy will be implemented as follows:

- Management will continue to develop policies and procedures that will assist in the control of personal injury, property damage and losses and fleet damage. Direct and indirect costs associated with these types of losses contribute unfavorably to operating expenses. These policies and procedures will be reviewed and updated as needed.
- Safety is the direct responsibility of all personnel. Safety is of prime importance to production and quality. Everyone has the right to stop work to address safety concerns.
- Safety on the job in all company facilities and job sites is a priority. In no instance will safety become secondary to any other considerations. Any recognized safety activity or hazard will be corrected.
- It is mandatory that all personnel engaged in work on this project comply with all federal, state and local safety codes and regulations throughout the duration of their construction on this project.
- Each site will have a Supervisor available to support the safety effort.
- Each Supervisor will be assigned various levels of safety responsibility and authority.
- All employees will be held accountable for the safety policy.
- An established system of communication, measurement, and documentation exists throughout the company.
- A Safety Committee is in place to formulate and update the company safety program and policies. This committee operates under the supervision of management.

Health and Safety Communication

This Webcor/Obayashi Joint Venture project plan will be developed incrementally as trade packages are awarded and trade subcontractors are brought on board. Each trade subcontractors plan will become part of Webcor /Obayashi's overall project plan and will be submitted to the Transbay Joint Powers Authority (TJPA) as they are received.

Orientation

The Webcor/Obayashi Joint Venture training will contain required elements stipulated by Webcor/Obayashi Joint Venture Code of Safe Conduct and Work Practices.

Webcor/Obayashi Joint Venture and ClickSafety have partnered to create a web-based Contractor Safety orientation course for the Transbay Transit Center. All contractors requiring access to the Transbay Transit Center project must successfully complete the three (3) required sessions online through ClickSafety prior to working on site. This site-specific safety orientation will take approximately one (1) hour to complete the three (3) sessions:

- Webcor/Obayashi Safety Passport
- Webcor/Obayashi Click Green Construction Practice
- Webcor/Obayashi Transbay Transit Center Project

The three sessions' includes a discussion on site protocol, evacuation procedures, a description of the logistics of the site, safety expectations and requirements that employees are expected to understand and comply with while working on the premises. These sessions are available in both English and Spanish.

Subcontractors are required to provide other task specific orientations as needed.

ClickSafety - Project Fees

The fee structure for ClickSafety services is a *$100 annual fee per user.

**Prorate will apply to those that begin the training after the first quarter of the current year.*

The prorate schedule is as follows:

January – June	$100	Valid January – December
July – December	$50	Valid July 1 – December

ClickSafety – Account Setup

These steps are to assist Contractors in setting up their account, user registration and implementation of ClickSafety.

1. Access ClickSafety's Transbay Safety Passport home page at http://www.clicksafety.com/safetypassport-transbay/
2. Create a company account. Click on the *Company* tap, then on *Register Company*, follow the prompts
    a. If your Company already have an account, your Company will still need to register your existing account for this project
3. Assign the three sessions:
    a. Webcor/Obayashi Safety Passport
    b. Webcor/Obayashi Click Green Construction Practice
    c. Webcor/Obayashi Transbay Transit Center Project

4. Prepay for employee training with a credit card and create an access code
    a. Keep this access code available as your employees will be required to enter it when they register
5. Direct all employees to ClickSafety's home page to conduct their on-line orientation
6. Employee Registration:
    a. Click on the *User* tab
    b. Then on *Register For Training* tab
    c. Select *Webcor/Obayashi TransBay Terminal* from the drop down menu
    d. Enter first name, last name, last 4 digits the employees social security number (SSN)
        i. Employees user name will be the first letter of their first name and there full last name, there password is the last 4 of their SSN
    e. Select preferred language to receive training in
    f. Select your Companies name from the drop down menu
    g. Enter access code
    h. Continue
    i. The three sessions will appear in the employees screen. Please ensure all employees complete each session

ClickSafety - Contact
A ClickSafety representative is available to answer any of your questions about this program. For general information about this project or registration assistance, please contact ClickSafety Support at (925)855-SAFE (7233) ext. 629 or cshelp@clicksafety.com. ClickSafety's Account Manager is Christina Parkin, (925)208-2618, Email: cparkin@clicksafety.com.

Should you have specific questions regarding the project or safety requirements, you may contact Webcor Builders Administrative Assistance for the EHS Department Kyla Burke at (510)748-1994 or at kburke@webcor.com.

ClickSafety - Disclaimer
ClickSafety and Webcor/Obayashi Joint Venture make this training material available with the understanding that users exercise their own skill and care with respect to its use. It is the duty of each employer as specified in the Occupational Safety and Health Act of 1970 (P.L. 91-596)

> (a1) Shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;
> (a2) shall comply with occupational and health standards promulgated under this Act.
> (b) Each employee shall comply with occupational safety and health standards and all rules, regulations, and orders issued pursuant to this Act which are applicable to his own actions and conduct.

Emergency Response Procedures

Webcor/Obayashi Joint Venture provides a safe and healthful work environment for all workers through progressive, proactive injury prevention planning. Job pre-planning and identification of up-coming potentially hazardous activities is supported by regularly reviewing trend analysis. Everyone on site has a

responsibility for their own safety and the safety of their work environment. If an activity is deemed unsafe workers have several ways to communicate these activities to management. Workers shall always contact their immediate supervisor and Webcor/Obayashi Joint Venture SSM if something is unsafe or an incident occurs.

Prior to starting work on this project a designated area for emergency service vehicles to enter without any delay shall be established. A current, certified First Aid/CPR/AED trained individual must be on site during work operations. All employees shall be instructed in the proper chain of command for reporting emergencies. 9-1-1 may be called at any time for an emergency by anybody on site. Each trade subcontractor and tiered subcontractor shall maintain a Cal/OSHA approved First Aid Kit on the Project at all times. An investigation will be conducted by the controlling employer's Project Management, Supervisor and SSM/DSP, under the direction of Webcor/Obayashi Joint Venture Project Management and SSM.

Reporting and documenting all accidents, incidents and near misses, is extremely important to track trends and investigate possible root causes. All on-site incidents, accidents and near misses shall be reported to Webcor/Obayashi Joint Venture Project Management and SSM immediately. All accidents resulting in industrial injuries or illnesses occurring on the jobsite will be thoroughly investigated. Completion of appropriate forms, as defined in the Incident Reporting Instruction section must be completed and submitted immediately after occurrence. Depending on the severity of the incident a Detailed Incident Analysis (DIA) may take place.

The scene shall be left *as is* for investigation purposes as well as safeguarded to ensure the safety of other nearby workers until Webcor/Obayashi Joint Venture Management Team releases it. Identification and review process of root causes shall be completed. Corrective actions, identification of persons responsible for corrective actions, and date of completion must be established. Follow up documentation verifying corrective action completion is required. Lessons learned from the DIA reviews will be shared with the project.

OSHA and the National Safety Council (NSC) define the following:

> "Accident - The National Safety Council defines an accident as an undesired event that results in personal injury or property damage.
>
> Incident - An incident is an unplanned, undesired event that adversely affects completion of a task.
>
> Near Miss - Near misses describe incidents where no property was damaged and no personal injury sustained, but where, given a slight shift in time or position, damage and/or injury easily could have occurred."
>
> *(osha.gov)*

Near Miss

A near miss is an unplanned event that does not result in injury or property damage.

First Aid

A first aid case is one where a person is injured requiring minor first aid treatment that does not required medical attention or prescription medication.

Minor Injuries

Minor injuries are those which require only immediate first-aid treatment and do not result in modified work or lost work days.

Major Injuries

A significant accident is where personal injury is sustained or tangible property loss is sustained, or where the event posed a significant threat of loss or personal injury. Major injuries or illness may be those which require extended medical treatment, hospitalization resulting in loss of work time, or result in death, disfigurement, or dismemberment.

In the event of a major injury, emergency vehicles shall be directed to enter the Project at a site entrance that will be determined as conditions change on the logistic map. Upon entering the project, the emergency personnel shall be directed to the exact location of the injured person/s. While awaiting arrival of the Emergency Vehicle(s), the injured shall not be moved unless he/she is in immediate danger of additional injury in his/her current location. Equipment and material involved in or responsible for the accident shall not be disturbed unless it presents an additional danger to the injured person(s).

Immediately after the accident, Webcor/Obayashi Joint Venture Management team will meet with the responsible trade subcontractor's Superintendent and/or Foremen, review the conditions, and direct the appropriate corrective action. The trade subcontractor is responsible for ensuring the injured employee/s are escorted to and from medical facilities, reporting employee/s condition to Webcor/Obayashi Joint Venture regularly and completing and submitting a copy of all required incident reports to Webcor/Obayashi Joint Venture SSM.

Persons who have sustained head injuries, major impacts, or whose injuries are the result of a fall shall be evaluated and stabilized by a professional medical personnel and provided transportation to the medical facility. Upon return from treatment, the employee shall return to work ONLY if so released in writing by the attending physician. If required by law, injury notification to OSHA must be coordinated through the Webcor/Obayashi Joint Venture Corporate Safety Director.

Within 24 hours of a major injury, Webcor/Obayashi Joint Venture shall conduct a Safety Meeting with attendance required of all jobsite personnel.

The recommended local Emergency Medical Facilities are:

St. Francis Health Center	**St. Francis Memorial Hospital**	**SF General Hospital**
24 Willie Mays Plaza	900 Hyde St	1001 Potrero Ave
San Francisco, CA 94107-2134	San Francisco, CA 94109	San Francisco, CA 94110
(415) 972-2249	(415) 353-6000	(415) 206-8000

Incident Reporting

This Section will conform to Specification Sections 01 13 40 (1.5 A thru C) 01 15 45 (1.9 A thru C) found in The Transbay Transit Center Contract Number 08-04-CMGC-000

A TJPA Representative will inform Contractors of any additional hazardous condition encountered in writing. Trade subcontractor shall respond indicating there action or disposition of the matter by returning

an annotated copy of the written communication to the TJPA Representative within three (3) days. If death, serious injury, multiple injuries or serious damages occur, the accident shall be reported at once by telephone or messenger to the TJPA as well as to the proper governing authorities. In addition, trade subcontractors shall promptly report in writing to the TJPA all accidents whatsoever arising out of or in connection with the performance of the work whether on or adjacent to the site, giving full details and statements of witnesses. Within three (3) days of occurrence, the trade subcontractor shall provide the TJPA with two (2) copies of the trade subcontractor's accident and near-miss reports.

If a claim is made by anyone against the any trade subcontractor on account of any accident, the trade subcontractor shall promptly report the facts in writing to the TJPA, giving full details of the claim. Contractor shall provide the TJPA Representative copies of any laboratory test data, and medical monitoring results for record and evaluation within three (3) days of receipt of the above information or upon the request of the TJPA Representative.

All incidents, accidents and near misses shall be immediately reported to Webcor/Obayashi Joint Venture Project Management/SSM and fully investigated. Investigation shall be completed to identify the possible contributing factors and the corrective actions. A DIA will be completed for major injuries, severe property damage and as needed per Webcor/Obayashi Joint Venture Management Team. Trade subcontractors shall complete required incident packages and return them to Webcor/Obayashi Joint Venture SSM within 24-hours.

Accident Investigation

The initial accident investigation is to be completed within 24 hours, with immediate notification of Webcor/Obayashi Joint Venture safety. Identification and review process of contributing factors of the accident, incident or near miss must be completed. Corrective actions, identification of persons responsible for corrective actions, and date of completion must be established. Follow up documentation verifying corrective action completion is required. Lessons learned from a DIA may be shared with the project, regionally and globally.

Detailed Incident Analysis (DIA)

To identify details in incidents, accidents, near misses and at-risk behavior Webcor/Obayashi Joint Venture and trade subcontractor management will be required to, within 48 hours of the incident, conduct a Detailed Incident Analysis (DIA). The DIA will analyze any accidents, incident, near misses, environmental incident, or impact to existing facilities and operations. Accident trends will be identified and plans developed to prevent additional incidents from occurring. The DIA will be performed involving at least the Webcor/Obayashi Joint Venture Manager and SSM and trade subcontractor project teams. The mission of these meetings will be to identify problem areas, develop specific action plan(s) to address contributing factors and to immediately implement corrective actions. Webcor/Obayashi Joint Venture will periodically review implemented plans for effectiveness. Lessons learned from the DIA will be shared with the project, regionally and globally.

Responsibilities for Safety & Loss Control

The objective of this Project Safety Overview (PSO) is to establish that safety and health must be addressed throughout the entire project. The prevention of accidents and protection of property are company values and are integral to our success. All safety issues shall receive active support and participation by the entire project team.

The principles of safety and loss control are intended to prevent injuries on the jobsite and to reduce the potential for damage to property and equipment. No phase of construction is of greater importance than incident and accident prevention.

Planning for safety starts with project design and continues through purchasing, fabrication and construction in all phases of the project. Practical steps will be taken to maintain an injury free environment. All trade subcontractors must accept responsibility for preventing accidents and be responsible for thorough safety and loss control training and instruction for their workers.

The primary objective of the Webcor/Obayashi Joint Venture PSO is to coordinate the elimination or reduction of risk associated with the construction of the project. Associated missions are to promote safe work practices/behaviors, prevent accidents, prevent worker injuries, prevent damage to property, and promote maximum efficiency and effect savings by reducing unplanned business interruptions.

Active participation by Webcor/Obayashi Joint Venture management, trade subcontractors, tiered subcontractors and all workers will make the program effective and successful by coordinating the participants' efforts in performing the following tasks:

- Providing a safe environment in which workers can perform high quality work.
- Using Job Hazard Analysis (JHA) as a tool to reduce injury to persons and property.
- Conduct jobsite safety audits to locate and abate unsafe work practices/behaviors and unsafe conditions.
- Protecting the public and property potentially affected by Webcor/Obayashi Joint Venture sites.
- Educating and training workers through new hire and site specific orientation and safety meetings.
- Task specific safety training.
- Personal Protective Equipment (PPE) programs.
- Immediate injury reporting and effective record keeping to maintain an up-to-date accident experience and trends analysis.
- Use of audit forms to abate deficiencies and eliminate any additional losses.

Webcor/Obayashi Joint Venture Responsibilities

Management Team

Webcor/Obayashi Joint Venture Management Team is responsible for construction management services for the Transbay Transit Center. The Management Team is also responsible for encouraging, reinforcing and modeling Webcor/Obayashi Joint Venture culture, including injury free environment initiatives, participating in the development and assessment of Environmental Health and Safety (EHS) leading indicators, reviewing and approving project corrective action/recovery plans. Furthermore the Management Team shall institute accountability when action plans and culture are not maintained and has the authority to stop any operations that pose a potential threat.

Project Manager

The Webcor/Obayashi Joint Venture Project Manager(s) are responsible for construction management services for the Transbay Transit Center as well as determining if contract documents and specifications support the project's safety missions and objectives. The Project Manager shall also monitor trade subcontractor selection process and adherence to established guidelines, conduct periodic auditing of trade subcontractor's safety plans for compliance with the Webcor/Obayashi Joint Venture 's Environment Health & Safety Procedures (EHSP), participating in pre-task planning and trade

subcontractor pre-construction safety meetings, document weekly jobsite safety audits and support Webcor/Obayashi Joint Venture SSM for obtaining corrective actions necessary to comply with Webcor/Obayashi Joint Venture EHSP. The Project Manager must be aware of loss control and public protection requirements of the project, they must participating in fact finding, Detailed Incident Analysis (DIA), and the implementation of corrective actions. Project Manager's shall promote and support our injury free culture.

Superintendent

It is the responsibility of Webcor/Obayashi Joint Venture Superintendents are to oversee safety on the jobsite. The Superintendent's EHS responsibilities include overseeing the planning and execution of all work in compliance with the Webcor/Obayashi Joint Venture EHSP and contract specifications. The Superintendent needs to be aware of loss control and public protection requirements identified in the safety specifications of the contract documents, promote and support our injury free culture and support Webcor/Obayashi Joint Venture SSM in obtaining corrective actions necessary to comply with Webcor/Obayashi Joint Venture EHSP. Furthermore, the Superintendent shall complete and review daily jobsite safety audits to ensure identified hazards are addressed in a timely manner, monitor and participate in JHA planning and shall participate in incident investigation, DIA meetings, tailgate meetings, pre-construction meetings, kick off meetings and implementation of corrective actions. Superintendents must take appropriate action to abate identified unsafe conditions and practices and document corrective actions.

Site Safety Manager

The Webcor/Obayashi Joint Venture Project Site Safety Managers (SSM) has a responsibility for the safety and health on the project. The Webcor/Obayashi Joint Venture SSM is considered to be the program administrator and has the authority delegated by Webcor/Obayashi Joint Venture Corporate EHS Department to implement and promote safety as well as setting project missions and milestones goals and reporting indicators for all project personnel. Webcor/Obayashi Joint Venture SSM manager may assign all or some of these tasks to other responsible persons as appropriate.

The SSM must help ensure that the guidelines, rules and procedures in this document are followed for site work. The SSM shall be familiar with local emergency services, help ensure that the proper steps are taken in the case of emergencies when a major event resulting in a fatality, multiple injuries, or property loss occurs. The SSM is responsible for requiring that we preserve the accident scene in an "as is" condition, including any construction equipment involved, to allow for a proper investigation. The SSM must order, if necessary, the area or piece of equipment to be stabilized to preclude further injuries or loss. Furthermore, the SSM shall notify Webcor/Obayashi Joint Venture Project Manager should an OSHA inspection be required. Should citations, warnings or safety violations be issued Webcor/Obayashi Joint Venture Management Team shall receive copies within 48 hours.

The SSM will be conducting or taking the necessary steps to help ensure that tool box/tailgate safety meetings are conducted before work startup. Additional meetings may be required for specific job tasks or site activities. Webcor/Obayashi Joint Venture SSM also must help monitor the maintenance and inspection of PPE, onsite hazards, the physical condition of site personnel, and perform daily safety audits of work site activities. Furthermore the SSM shall maintain safety files, which will include training and applicable medical certifications, environmental testing and special associated training, tool box/tailgate meeting notes and rosters, safety observation/audit reports, investigation reports including near-misses, injury summaries, required safety permits, security issues, or other safety and health documentation, as applicable.

The SSM is responsible for supporting Project Management in achieving an injury, incident and impact free environment as well as reporting all accidents and incident to the Project Manager in a timely manner as well as a responsibility for overseeing development, implementation and maintenance of the project's safety program by expediting corrective action(s) to abate any observed or potential safety exposure(s) to workers. The SSM shall continuously monitor trade subcontractor's safety performance and expedite abatement action(s) report unsafe acts and conditions and notify Webcor/Obayashi Joint Venture Project Manager and Superintendent regarding advisable corrective actions.

More duties of Webcor/Obayashi Joint Venture SSM include monitoring the subcontractor's compliance with the Webcor/Obayashi Joint Venture EHSP and to help familiarize sub-contractors and trade subcontractor Project Managers, Superintendents and Supervisors with the Webcor/Obayashi Joint Venture EHSP. These individuals must be familiar with safety and health hazards to which all workers may be exposed, as well as applicable laws, regulations and safety rules and policies and how to handle emergency situations. SSM is to help assure that all workers are trained in accordance with applicable requirements and ensure that observations, inspections, recognition, evaluations and abatement of hazards are conducted on a continuous basis. If the subcontractor does not make immediate corrections after initial notification, Webcor/Obayashi Joint Venture EHS will notify the subcontractor's Project Management in writing to make prompt corrective action to help eliminate construction safety concerns, forward copies of the written notice to Webcor/Obayashi Joint Venture Project Management and develop the direction to help resolve outstanding construction safety issues and maintain documentation of corrective actions.

The SSM is responsible for ensuring a Hot Work Permit is completed prior to hot work commencing and shall keep a log of all Permits.

Project Engineer
The Webcor/Obayashi Joint Venture Project Engineer assists the Webcor/Obayashi Joint Venture Project Manager with his/her responsibilities for construction management services for the project. This person will complete weekly jobsite safety audits, participate in pre-task planning, subcontractor pre-bid, pre-construction, and/or kick-off meetings, assist with jobsite safety startup, safety orientations, participate in fact finding, Detailed Incident Analysis (DIA), implementing corrective actions to prevent further occurrences on all injury/incident investigations and attend and/or participate in jobsite safety meetings.

Subcontractor Responsibilities

The subcontractor has overall responsibility for accident prevention and implementation of this Webcor/Obayashi Joint Venture EHSP for anyone under their control, including their respective employees, tiered subcontractors, vendors and suppliers.

Where subcontractor is not using a Site Safety Manager (SSM) the subcontractor will assign safety responsibilities to a member of their Project Management, that person(s) will be considered a Designated Safety Person (DSP). This assignment is subject to approval by Webcor/Obayashi Joint Venture Management and Webcor/Obayashi Joint Venture SSM. The subcontractor may be responsible for providing their SSM or DSP with a reliable communication method or device in order to contact Webcor/Obayashi Joint Venture Project Management and Webcor/Obayashi Joint Venture SSM during emergency response and/or other safety related communications. Although many existing hazards may be corrected through informal communications between the trade subcontractor's and tiered subcontractor's SSM or DSP with members of Webcor/Obayashi Joint Venture Project Management, all corrective actions must be documented, with copies forwarded to Webcor/Obayashi Joint Venture Project SSM.

Subcontractors will submit a copy of their companies and their tiered subcontractors company's safety program prior to beginning work. All subcontractor workers must be orientated to their company's safety program as well as to applicable sections of this Webcor/Obayashi Joint Venture EHSP. Furthermore, subcontractors and tiered subcontractors are required to incorporate the requirements of the Webcor/Obayashi Joint Venture's EHS Plan into their safety programs and safety orientation if theirs are less protective than those of Webcor/Obayashi Joint Venture.

Project Manager
The subcontractor's Project Manager is responsible for planning and monitoring all work performed in compliance with the objectives of this Webcor/Obayashi Joint Venture EHSP, trade subcontractor's safety program, federal, state and local safety and health regulations. Authorizing immediate correction of any existing construction safety-related concerns, fully supporting the SSM or DSP and cooperating with all designated project safety personnel in obtaining corrective actions necessary to comply with the Webcor/Obayashi Joint Venture EHSP. Furthermore, trade subcontractors Project Managers shall complete weekly safety audits, participate in pre-task planning and subcontractor kick-off meetings, participating in fact finding, DIA, and resolution on all injury/incident investigations as well as when requested, attend special construction safety meetings.

Superintendent/Supervision/Foremen
Responsibilities of the trade's subcontractor Superintendent/Supervisor/Foremen are the same as Webcor/Obayashi Joint Venture Superintendent/Supervisor/Foremen and they shall attend weekly contractors' safety meetings.

All supervisory personnel shall have as a minimum the OSHA 30 Hour Construction Safety training within the prior four years and possess a current CPR /First Aid and AED certification. In addition supervisory personnel shall have at a minimum 5 years' experience as a superintendent in a similar type of project.

Site Safety Manager / Designated Safety Person
Every trade subcontractor employing **40** or more workers, including their lower tier sub-subcontract employees, must provide a full-time SSM/DSP that has no other job duties and is present on the project anytime work is being performed. An additional DSP shall be required for each additional **60** workers thereafter. Subcontractor shall also provide EHS Administrative support personnel as necessary to implement their EHS program. Contractor reserves the right to determine appropriate qualifications for Subcontractor's SSM/DSP personnel, based on project demands and reserves the right to interview candidates to determine qualifications.

The SSM/DSP shall be current in First aid/CPR/AED and hold a Construction Health and Safety Technician (CHST) and OSHA 500 certificate and have three (3) years prior full time safety duty experience working on a similar type of project at a minimum. The SSM / DSP is responsible for ensuring a Hot Work Permit is completed prior to hot work commencing. The Fire Safety Manager shall keep a log of all Permits. Subcontractors SSM shall serve as technical advisors to their project management team on safety and health planning, training and problem resolution issues.

The SSM/DSP shall report all incidents and injuries immediately to Webcor/Obayashi Joint Venture Project Management and SSM. In the event of an accident or injury the trade subcontractors Project Manager and SSM shall complete and forward all claim forms; injury, liability, property damage, and the

like, to Webcor/Obayashi Joint Venture SSM immediately. The SSM shall participate in accident investigations and recommend proper courses of corrective action. When serious accidents occur, this task will be performed in conjunction with Webcor/Obayashi Joint Venture SSM and Webcor/Obayashi Joint Venture and the subcontractor Project Management or their representatives. Each SSM/DSP has the right and authority to stop any and all hazardous work activities being performed by his/her company or their subcontractors until necessary corrective actions are taken or if there is an immediate danger to lift and/or health present.

The SSM/DSP shall perform continuous safety audits of all their respective trade subcontractors and their tired subcontractors' work areas throughout the entire workday and take immediate action to eliminate all unsafe acts and/or conditions. These observations, along with corrective actions taken shall be reported in writing to the appropriate member of Webcor/Obayashi Joint Venture Project Management, SSM and the subcontractor's own management. The SSM/DSP shall ensure that prior to the commencement of any work activity every Supervisor/Foreman reviews each task assignment with every affected employee to ensure a comprehensive understanding of the safety requirements and precautions to be followed while performing this work. This shall be documented using a JHA. The SSM/DSP shall ensure that appropriate PPE is provided and its use enforced, ensure that all of the necessary guards are in place, safety equipment is provided, and other required steps are taken prior to starting the work.

The SSM / DSP shall attend and participate in required safety meetings. The SSM / DSP shall provide appropriate materials for those conducting weekly tool box/tailgate meetings or safety meetings, as well as, review safety meeting reports for attendance and implement required safety training programs for subcontractor employees and supervisors. The SSM / DSP shall enforce their company's safety program and disciplinary procedures, accompany Webcor/Obayashi Joint Venture's supervisory personnel as directed and perform joint inspections of work areas and activities, orient all new personnel to the site's safety program prior to work commencement and the SSM/DSP are subject to Webcor/Obayashi Joint Venture's approval and may be removed at any time with or without cause and replacement personnel shall be provided at the subcontractor's / employer's expense.

Everyone's Responsibilities

Everyone has the ability to stop work for safety reasons. Everyone shall report injuries, near misses, unsafe acts and conditions immediately to supervision. Everyone shall work according to good safety practices as posted, instructed and discussed. Everyone shall comply with Webcor/Obayashi Joint Venture EHSP and subcontractor's safety program. The use of all required safety devices shall be used. Everyone shall come to work alert and free of any impairment that may affect safety. Everyone is to keep their work areas clean and orderly as well as promote and support the Injury Free Environment. Everyone agrees to be held accountable for your safety, and the safety of others. Furthermore, everyone is held accountable for their designated assignments of responsibilities as denoted in their respective definitions. Refrain from performing any work which may feel unsafe or for which proper equipment and/or training have not been provided. Everyone has the right to stop work when an unsafe condition or act occurs.

Weekly Safety Meetings

Trade subcontractors and tiered subcontractors are required to hold Weekly Safety "Tool Box" Meetings with their field crews. Copies of the meeting minutes and attendees shall be submitted to Webcor/Obayashi SSM at the end of each week. Webcor/Obayashi Joint Venture may provide assistance and information to trade subcontractors and their tiered subcontractors as requested.

In addition, subcontractors and tiered subcontractors are to attend monthly or whenever determined by Webcor/Obayashi Joint Venture all hands safety meeting.

Pre-Task Planning

Pre-planning tasks has been proven to reduce incident and accidents. All workers engaged in a specific task are required to participate in pre-planning activities. Every worker has the right to stop work and contact management if unsafe acts or conditions occur.

Job Hazard Analysis (JHA) Guidelines

A JHA is to be conducted daily, led by the Supervisor of the crew, documented in writing and signed by all crew members prior to starting work. JHA's shall include hazards relating to the task being done and the plan of actions the crew shall take to mitigate that hazard from occurring.
The JHA shall be readily available at the work site and posted and/or placed where crew members have knowledge of its location at the work area. JHA's should be reviewed and revised whenever work conditions or crew membership change that may affect the ability to safely complete the work.

A JHA is required for the following activities (at a minimum):

• Chemicals: hazardous & irritant	• Concrete: pre-cast, tilt up, vertical, form work
• Confined Space	• Hoisting & Rigging activities
• Demolition	• Framing activities
• Excavation & Trenching	• Fall Hazards: elevated work, overhead work
• Material Handling	• Non-routine activities
• Public Exposure	• Scaffolding
• Steel Erection	• Startup/Shut down/ System testing
• Working with hazardous materials	• Introducing chemicals into systems

Safety & Health Training/Information

This Section will conform to Specification Section 01 15 45 (1.10A) found in The Transbay Transit Center Contract Number 08-04-CMGC-000

Trade subcontractors and their tiered subcontractors shall maintain, on-site, all training records in accordance with federal, state, and local statutes, regulations, and policies, and provide copies of these records to Webcor/Obayashi Joint Venture Management and the TJPA upon request.

New workers will be provided with initial training and/or orientation prior to assignment or when assigned to a new task for which training has not been received. Training will include general area and specific assignment topics. Refresher training will be provided in accordance with Federal/State OSHA guidelines. Completed training records are to be submitted to Webcor/Obayashi Joint Venture SSM in a timely manner. Supervisors are expected to be knowledgeable and informed on hazards and safe work practices in their area of responsibility and to coordinate the disbursement of this information to crews.

Training may include, but not be limited to:

• Aerial / Boom Lifts	• Asbestos awareness
• Confined Space	• CPR / 1ST aid / AED
• Electrical	• Excavation & Trenching

• Fall Protection	• Fire Watch
• Forklift	• Hazard Communication
• Hazardous Chemicals	• Ladder
• Lasers	• Lead Awareness
• Lockout / Tagout (LOTO)	• Powder Actuated Tools
• Respirator Protection	• Rigging
• Scaffolding: Use & Erection / Dismantle	• Steel Erection
• Job Hazard Analysis	• Accident Investigation (Management)

Code of Safe Conduct and Work Practices

The following Safety Procedures will be complied with on the Transbay Transit Center project**.** These Safety Procedures are in accordance with Webcor/Obayashi Joint Venture Safety Program, the TJPA and the division of Industrial Safety Cal/OSHA Construction Safety Orders.

General

All subcontractors must submit their Company's Project Safety Program to the Project Site Safety Manager (SSM) prior to the start of their work. As a minimum, the subcontractor's Safety Program shall meet or exceed Webcor/Obayashi Joint Venture safety requirements, the applicable parts of the Webcor/Obayashi Joint Venture Corporate Safety Manual, the contract documents and federal, state, local or other applicable regulations.

Prior to trade subcontractors arrival, measures to identify, monitor and control the workers and the general public from identified hazards shall be included in their safety plans. The Program shall be reviewed by the Webcor/Obayashi SSM who may require additional written Safety Procedures and training records as may be necessary to address the potential hazards of the operations.

Personal Protective Equipment (PPE)

All persons entering the work area shall wear the proper PPE at all times.

Hardhats

All persons entering the work area on this project are required to wear ANSI Z89.1 approved hardhats. 100% hardhats use is required at all times while on this project. Any person refusing to wear a hardhat will be immediately dismissed from the project site. Metal hardhats and "Cowboy" hardhats are not allowed to be worn.

Eye Protection

The wearing of eye protection will be strictly enforced at all times. 100% safety glasses use is required at all times while on the project. ANSI approved prescription glasses with side shield are acceptable as well as ANSI approved goggles.

Hearing Protection

Each trade subcontractor shall provide and enforce the use of hearing protection for all workers exposed to noise levels exceeding 85 decibels (db). Where hearing protection is required, signs stating so shall be posted.

Hand Protection
Hand protection must be worn 100% of the time in any situation where hand/finger exposure to hazards exists, unless the manufacture of the equipment/material being used states gloves should not be worn. Supervisory Positions, Visitors, and Observers of work are not required to wear hand protection 100% of the time as they are not performing work, but must have gloves readily available in case a situation where hand/finger exposure to hazards arises.

Clothing & Foot Protection
All personnel shall wear safety vests, work boots or acceptable work shoes while employed on this project and keep their clothing and footwear in good condition at all times. Long pants and shirts with "T-shirt-length sleeves or longer shall be worn at all times. No sneakers, tennis shoes, soft-suede/canvas hiking boots, shorts, tank tops, tattered clothing etc., will be allowed.

Additional foot protection shall be used with jumping jack compactors and jackhammers.

Safety Disciplinary Policy
Under Webcor/Obayashi Joint Venture, all employees are required to follow company safety policies and operating procedures. When needed, employees will be provided with additional training and information, or retraining to maintain their knowledge.

Although Webcor/Obayashi Joint Venture reserves the right to discharge "at will," we believe that employees found performing work in an unsafe manner that would endanger the employee or another employee shall be subject to discipline or termination by management. Webcor/Obayashi Joint Venture strictly maintains a zero tolerance policy towards violations involving, but not restricted to: fall protection, lock-out/tag-out, and confined space violations. The Webcor/Obayashi Joint Venture Project Management and SSM shall determine the course of action best suited to the circumstances. The steps to be taken at a minimum shall include the following:

Verbal Warning – As the first step in correcting unacceptable behavior, the Supervisor shall review the pertinent facts with the employee. The Supervisor will consider the severity of the problem, and the employee's past performance. A verbal warning will be issued to the employee, if necessary; the employee will be placed on probation.

Written Warning – If the unacceptable performance continues, the next step will be a written warning. The written warning will clearly state the safety policy that was violated. Probation will be a part of the written warning. It may also include time off without pay. At the completion of the probationary period, the Supervisor will meet with the employee to determine if the employee has achieved the required level of performance.

Termination – The employee may be terminated if said employee does not improve their performance while on probation, or has violated another company safety policy within twelve (12) months.

Dismissal from Project
The following is prohibited and the individual(s) engaging in such activity(s) may be subject to dismissal from this project:

- Fighting and horseplay.
- Alcohol consumption or controlled-substance use on the site.

- Crowding or pushing while accessing work levels on ladders, scaffolds, etc.
- Throwing trash or any objects from heights.
- Using fire equipment irresponsibly.
- Destroying property or the work of other trades.
- Stealing.
- Gambling on the project site.
- Unsafe work habits.
- Persons using prescribed medication must notify his/her employer of such use prior to going to work or taking the medication.
- Working while your ability or alertness is so impaired by illness or fatigue or other causes that it might unnecessarily expose you or others to injury.
- Noncompliance of any safety rules or regulations.
- Lewd or abusive language towards jobsite personnel, Owner's personnel, or any member of the public.
- Smoking Cigarettes/E-Cigarettes in unauthorized areas

Job Vehicular Traffic

Only company-owned vehicles with signage are continuously required for the pursuit of trade subcontractor's and tiered subcontractor's work, and trucks delivering materials may be allowed access to the project site. All construction vehicle traffic access will be coordinated by Webcor/Obayashi Joint Venture.

There is no trade subcontractor or tiered subcontractor onsite parking on this project. Trade subcontractors and tiered subcontractors in violation of this request will be towed at their expense without further notice.

Subcontractors are to notify Webcor/Obayashi Joint Venture 48 hours in advance for approval of material deliveries. Material storage and layout must be approved by Webcor/Obayashi Joint Venture prior to delivery. Delivery vehicles will unload and depart the project site as soon as possible with the assistance of a qualified flagger to ensure pedestrian and vehicular traffic is controlled.

Subcontractors are reminded that continuous 2-way vehicular traffic must be maintained at all times for safe public accessibility unless posted otherwise. Two-way traffic control is to be provided by trade subcontractors prior to delivery vehicles entering the property.

Due to general liability exposure created by improper traffic control, all flagging, training, lane closures, etc. shall conform to the most current edition of the Manual on Uniform Traffic Control Devices (MUTCD). Local permitting issues shall be addressed by Webcor/Obayashi Joint Venture prior to the start of work. All workers in the traffic control area must be trained according to local, state and federal requirements and wear the appropriate reflective vest or high visibility clothing. Stop/Slow paddles shall be used to control traffic flow.

Temporary Offices

Temporary offices will be constructed of fire-resistant materials only and heated with approved fire-safe heating devices in accordance with manufacturers' instructions. Shall be equipped with a minimum of one 20lb ABC fire extinguisher and shall have a 40-gallon waste container adjacent to it. Temporary office locations must be approved by Webcor/Obayashi Joint Venture prior to installation.

Fire Protection

The purpose of the Fire Protection is to reduce to a minimum the possibility of fire damage and associated losses incurred during the construction of the Project. The following is a guide to be used on the Project to aid in preventing the spreading of materials loosed by fires and gases associated with combustion.

Appropriate action is the key to the prevention of loss of life and property damage. Emergency phone numbers will be posted in such a manner so as to be clearly visible. If a fire occurs, notify the local fire department and Webcor/Obayashi Joint Venture Management Team immediately. Extinguish fire with a noncombustible, such as sand, or an available fire extinguisher if properly trained to do so. Remove or shut off fuel supply and combustible material if trained and safe to do so.

General Fire Safety

- All temporary electric service, equipment, and wiring must be in accordance with Cal OSHA and NFPA 70, National Electric Code.
- Storage of any material within ten (10) feet of fire hydrants is strictly prohibited.
- Work areas shall be inspected on a regular basis to prevent accumulation of material.
    - All combustible waste material, dust, and debris shall be removed from the building and its immediate vicinity at the end of each work shift, or more frequently as necessary, for safe operations.
- No motors or machinery shall be left running during nonworking hours except as specifically directed by Webcor/Obayashi Joint Venture.
- All heating equipment shall have necessary Safety devices and shall be operated according to all applicable codes, rules and regulations, and manufacturers' instructions.
- All tarps and blankets shall be of fire-retardant material.
- All fuel and solvent containers shall be in approved containers and placed on drip pans.
    - Storage of these materials shall be in accordance with product Safety Data Sheet (SDS), statutory Hazardous Material requirements, and Fire Department requirements.
- No open or burning fires shall be permitted onsite.
    - Anyone doing so will be subject to immediate dismissal.
- No solid fuel shall be permitted on the site.
- Fire extinguishers shall be placed and maintained on the job in conspicuous and identified locations.
    - These fire extinguishers shall not be moved or discharged, except for fighting a fire.
- All gas bottles, such as propane, oxygen, and acetylene, shall be stored and secured in a vertical position in areas designated by Webcor/Obayashi Joint Venture.
    - All stored bottles shall be capped.
    - Oxygen and acetylene will not be stored within 20 feet of each other or must be separated by a one-half-hour-rated fire barrier.
    - At no time during construction shall propane or LPG be stored inside of a structure or building.
- All oxygen and acetylene in use shall be in proper carts with required separations and with at minimum a 10lb ABC fire extinguisher.
- During welding or cutting operations, a hot work permit and a fire watch with the proper fire extinguisher will be required and shall be the responsibility of the subcontractor or its tired subcontractor performing the work.
    - Hot work permits can be obtained from the SSM/DSP.

- Each trade is responsible for providing fire extinguishers and a fire-watch program for their work as required.

Hot Work Activities
When all fire prevention measures are taken, permits shall be authorized for the work. New construction work shall require the presence of a dedicated fire extinguisher (20lb, ABC), provided by the trade subcontractor performing the work, and any other preventive measures as may be necessary for protection of life and property such as but not limited to fire blankets and water supply.
The trade subcontractor and the SSM/DSP shall ensure that the surrounding area(s) are free of combustible material. When the work is of the nature that hot material may fall to areas below, the trade subcontractor and the SSM/DSP shall ensure that those areas are free of combustible material or material that may otherwise be damaged. Work in place must be protected by the trade subcontractor performing the work.

Each trade subcontractor and tiered subcontractor shall notify Webcor/Obayashi Joint Venture of proposed Hot Work activates through a Welding/Cutting Permit. The SSM/DSP shall review the Permit form with the trade subcontractor to assure that all areas of concern are accounted for in fire protection. Hot Work shall not be performed near fuel storage areas or other areas where combustible vapors may accumulate.

In occupied building, Hot Work shall not be performed in occupied buildings without notification of the local Fire Department responding agency. The fire suppression system for the building must be in operation. The appropriate Building or Department Managers must be notified and the work coordinated with their operations. Preparation for the work and clearing of combustible materials shall be in accordance with federal and state standards. Combustible material shall be cleared from the work area by a distance of 35 feet.

Material Handling

Housekeeping is an extremely important contributing factor for ensuring the safety and health in the workplace. Keeping aisles and passageways clear to provide for the free and safe movement of material handling equipment and employees is of the upmost importance. Other important contributing factors to ensure a safe working environment is as follows:

- Wear proper PPE at all times while handling material, equipment and tools.
- Post conspicuously the maximum safe load limits of floors within buildings and structures, in pounds per square foot, in all storage areas, except for floor or slab on grade.
    - Do not exceed the maximum safe loads.
- Do not store materials on scaffolds or runways in excess of supplies needed for immediate operations.
- Use ramps, blocking, or grading when a difference in road or working levels exists to ensure the safe movement of vehicles between the two levels.
- Do not place materials stored inside buildings under construction within six (6) feet of any hoist way or inside floor openings, or within ten (10) feet of an exterior wall which does not extend above the top of the material stored.
- Do not drop or throw blocks from an elevation or deliver blocks through chutes.
- Remove all nails from used lumber before stacking.
- When bending reinforcing steel on the job, use a strong bench set up on even dry ground or a floor to work on.

- Do not remove frozen material in a manner that would produce an overhang.
- Use proper lifting techniques.
- Stacking Material
    - Make sure that all materials stored in tiers are stacked, racked, blocked, interlocked, or otherwise secured to prevent sliding, falling, or collapse.
    - Stack bagged materials by stepping back the layers and cross-keying the bags at least every ten bags high.
    - When bags are removed from the pile, keep the length of the pile at an even height and maintain the necessary step backs every five bags.
    - When stacking inside a building, distribute the piles to prevent overloading the floor.
    - If not racked, stack and block structural steel, poles, pipe, bar stock, and other cylindrical materials as to prevent spreading or tilting.
    - Carefully pile structural steel to prevent danger of members rolling off or the pile toppling over.
    - Keep structural steel in low piles, giving consideration to the sequence of use of its members.
    - Stack corrugated and flat iron in flat piles, with the piles not more than 4 feet high; place spacing strips between each bundle.
    - Frequently inspect stock piles of sand, gravel, and crushed stone to prevent their becoming unsafe by continued adding to or withdrawing from the stock.
- Stacking Lumber
    - Do not stack lumber more than 20 feet high; if handling lumber manually, do not stack more than 16 feet high.
    - Stack lumber on level and solidly supported sills, and such that the stack is stable and self-supporting.
    - Stack stored lumber on timber sills to keep it off the ground. Sills must be placed level on solid supports.
    - Place cross strips in the stacks when they are stacked more than 4 feet high.
- Stacking Bricks
    - Do not stack bricks more than 7 feet high. When a loose brick stack reaches a height of 4 feet, taper it back 2 inches for every foot of height above the 4-foot level.
    - Never stack bricks, for storage purposes, on scaffolds or runways.
    - Always stack blocks; do not throw in a loose pile.
    - When stacking masonry blocks higher than 6 feet, taper back the stack one-half block per tier above the 6-foot level.
- Cement Bags
    - Carefully handle cement and lime delivered in paper bags to prevent the bags from bursting.
    - Do not pile cement and lime bags more than ten bags high except when stored in bins or enclosures built for the purpose of storage
    - When handling cement and lime bags, wear eye protection preventing any contact with the substance (such as goggles or other sealed eye protection) and wear long sleeve shirts with close fitting collar and cuffs.
    - Do not wear clothing that has become hard and stiff with cement.
    - Make sure to report any susceptibility of skin to cement and lime burns.
    - Make sure that a hand cream or Vaseline and eyewash is provided and kept ready for use to prevent burns.

- Store lime in a dry place to prevent a premature slacking action that may cause fire

Cleanup and Housekeeping

Trade subcontractors and tired sub-subcontractors shall leave the site clean and free of debris and hazardous materials by the end of each working day to the satisfaction of Webcor/Obayashi Joint Venture. Each subcontractor is responsible for removal of debris created by their work. Rubbish containers will be placed at a central location for the removal of trash and debris. Accumulation of trash and debris will not be tolerated. Webcor/Obayashi Joint Venture will perform necessary cleanup of same, at trade subcontractors' expense, upon failure to comply with cleanup notice request.

Ensure compliance with local fire regulations if disposing of waste material or debris by burning. Remove all scrap lumber, waste material, and rubbish from the immediate work area as the work progresses. Keep all solvent waste, oily rags, and flammable liquids in fire-resistant covered containers until removed from the work site.

Whenever materials are dropped more than 20 feet to any point lying outside the exterior walls of the building, use an enclosed chute of wood or equivalent material. When debris is dropped without the use of chutes, make sure that the area onto which the material is dropped is completely enclosed with barricades at least 42 inches high and 20 feet back from the projected edge of the opening above. Post at each level warning signs of the hazard of falling materials. Do not remove debris in this lower area until debris handling ceases above.

Security Services

Trade subcontractors and tired subcontractors shall be responsible for the security of toolboxes, onsite storage materials, etc.

Noise Control

This Section will conform to Specification Section 01 35 65 (1.2E) (1.8B), (1.8C) found in The Transbay Transit Center Contract Number 08-04-CMGC-000

Trade subcontractors shall conduct noise inspections and noise testing of equipment to ensure that all equipment on site is in good condition and effectively muffled per manufacturer's recommendation. Noise control shall be maintained by the trade subcontractors in all areas of construction, guarding against undue noise.

All motor-drive equipment shall have a proper exhaust system, which shall meet Cal/OSHA Standards on noise levels. Subcontractors are to post signage and provide proper hearing protection to employees using chipping guns, jackhammers, rock drills, or similar devices where the decibel level exceeds 85 and double hearing protection as required by state law.

Playing of radios, including headsets, is prohibited.

Combustible Material

Separate storage areas for acetylene, oxygen, and gasoline will be established by Webcor/Obayashi Joint Venture. The trade subcontractor shall post proper warning signs where combustible material is being used or stored. All gasoline will be in containers that meet NFPA and Cal/OSHA requirements, and will be stored in designated areas only.

All acetylene and oxygen bottles shall be secure and in a vertical position. All carts must be equipped with a fire extinguisher. All stored oxygen and acetylene must be separated from each other, by a minimum of 20 feet or a fire-rated barrier, with bottle caps secured in place as required by Cal/OSHA.

Crane

The safe operation and proper maintenance of cranes and rigging on the site shall be the overall responsibility of the trade subcontractor. Each trade subcontractor shall also be held accountable for compliance with CAL/OSHA crane regulations for all cranes or derricks on the site, whether contractor owned, leased or rented. All rigging inspection logs shall be completed and submitted to Webcor/Obayashi Joint Venture SSM monthly.

A thorough inspection by a certified independent 3rd party company shall be conducted prior to initial use and post repair of a crane or derrick. Any deficiencies found shall be corrected before the equipment is placed into service. A copy of the annual certification inspection performed by a certified independent 3rd party shall be submitted to the Webcor/Obayashi Joint Venture SSM prior to the crane being operated on site.

Each contractor shall designate a competent person who shall inspect all cranes and derricks daily as part of the trade subcontractor's job site inspection program. Such inspections shall be documented and submitted to Webcor/Obayashi Joint Venture SSM weekly. Defective equipment shall be removed from service and repaired; service/repair shall be documented and submitted to Webcor/Obayashi Joint Venture SSM.

Loads shall not be passed or suspended over persons. Routes of suspended loads shall be preplanned to ensure no workers or the public are directly below suspended loads. Lifts shall not be conducted over employees, visitors, or areas occupied by the public. Tag lines shall be used for controlling all loads. Tag lines or guide ropes shall be used to control all loads. Accessible areas within the swing radius of the rotating superstructure shall be properly barricaded to prevent employees from being struck or crushed by the crane.

Crane Lift Plan

A complete, competent and Webcor/Obayashi Joint Venture approved Crane Lift Plan is required prior to any crane lift while working. The Crane Lift Plan must be submitted to Webcor/Obayashi Joint Venture 48 hours (2 business days) prior to mobilization at a minimum. Neither TJPA nor Webcor/Obayashi Joint Venture shall be held responsible for any delay allegations as a result of the trade subcontractor failing to submit Crane Lift Plans on a timely basis. The Trade Subcontractor / Crane Company / Rigging Company is responsible for the accuracy of all calculations and inspections. This planning process has been established to help ensure proper coordination between trade subcontractors and Webcor/Obayashi Joint Venture. No warranty or certification of the suitability of this plan is accepted by Webcor/Obayashi Joint Venture.

The Crane Lift Plans must be based on a "worst case" combination of load weight with chart deductions and lift radius for a specific crane configuration in a specific location. Work that is not anticipated but may arise due to site conditions (moving equipment, loading materials onto floors, etc.) must be reviewed with Webcor/Obayashi Joint Venture prior to hoisting. Changes affecting crane configuration may require the Crane Lift Plan to be amended.

Lifts exceeding 75% of the cranes stability / structural capacity chart, requiring movement of a crane carriage with the load, personnel platforms, critical loads (long lead time, cost), tripping loads, work over occupied facilities, or work involving encroachment on public rights of way, will require the preparation, submittal and review of a specific JHA (Note: These lifts are discouraged). These lifts must be reviewed in advance. The Crane Lift Plan(s) may have to be prepared and stamped by a licensed Professional Engineer to be approved by Webcor/Obayashi Joint Venture.

Attachments to the Crane List Plan may include but are not limited to:

- Plot plan with crane location (identify swing path, delivery truck locations, location of any overhead power lines, etc)
- Elevation plan
- Crane load charts and calculations including any notes
- Dimension illustration and specifications for crane and range chart
- Operators license, training information, USDOT medical certificate and OSHA training
- Rigging plan, lists and diagram
- Names and qualifications for designated and competent persons (crane operator, A/D Supervisor, rigger and signal person
- JHA
- Logistics and assembly / dismantle plan
- 3rd party annual inspection certification
- Weight of material
- Lighting and wind restrictions (from operators manual)

The Crane Lift Plan may be valid for more than one day, as long as the configuration, location, maximum expected load, and maximum expected radius does not change. Multiple lift plans will be required for multiple locations.

Responsibility
It is the responsibility of the Trade Subcontractor and the Crane Operator to ensure that they and their employees are qualified, competent, properly equipped and properly trained to perform the activities outlined in this plan.

Management
The trade subcontractor is responsible to visit the site prior to the lift date to review documentary information pertaining to the site, which is maintained by Webcor/Obayashi Joint Venture. The trade subcontractor is responsible to obtain all information that is necessary to develop a power line safety plan, if needed. Furthermore, trade subcontractors are responsible for ensuring rigging equipment is in good condition and provided with safety devices as applicable. This includes such things as safety latches on hoisting hooks, chains, wire rope and slings are free from defects and conform to standard load ratings for work being done and eye splices conform to safety standards. Trade subcontractor's employee training is current and each contractor shall ensure that all of its employees involved in crane activities receive

comprehensive training as to their responsibilities. This training shall include hand signals and those authorized to give signals. Said training shall be documented.

Each trade subcontractor shall ensure that its crane operators is not engaged in any practices that may divert their attention while engaged in crane operations, ensure the operator is physically and mentally fit for duty, responds to only clear signals and stop signals. The trade subcontractor shall ensure the operator is intimately familiar with the equipment being used and is empowered to discuss any issues with their Supervisor.

Operator

Each crane operator will be specifically assigned the responsibility for safe operations and shall be given written instructions as applicable. Only designated operators who have been licensed by an approved agency or union and meet the requirements shall be in or on the crane during operations. The crane operator shall be responsible for determining the safe operation of their crane and the safety of each lift. The operator has the authority to refuse a lift due to safety concerns. For example refusing to lift any loads that are not safely rigged. Any manager, supervisor or person attempting to bypass the crane operator's authority on this issue will be immediately removed from the project. The operator shall immediately shut down the crane if the operator suspects any problems with the crane or if any part of the crane, rigging or load strikes any object. Immediately report the issue to Webcor/Obayashi Joint Venture Supervisor and SSM.

The operator is also responsible for assuring that routine maintenance is performed, as well as necessary repairs and to coordinate testing and maintenance personnel when necessary. Daily inspections shall be conducted to include but not limited to condition of brakes, functioning of safety devices and limiting devices, electric power installation, overload controls, conditions of the structural membrane and ensure a fire extinguisher is available and current.

Verification of a current annual inspection certification shall be available for the crane. Verification that manufacturer's rated load capacities, recommended operating speeds, and special warnings or instructions are posted on the crane and are visible from the operator's station. Upon request the operator may be asked to demonstrate their knowledge of the crane and the crane load chart among other items.

Responsibility for assuring that signaling and communications are adequate. This includes making sure that personnel at materials loading and receiving areas use correct hand signals. Where conditions require, radio communications will be used with a clear channel for crane operations. Making sure that adequate clearances exist between operating areas and nearby structures, especially power lines. Ensure that good housekeeping is maintained in and around the equipment. The operator shall never leave the controls while there is a load on the hook.

Training Requirements

Training records must be submitted to Webcor/Obayashi Joint Venture SSM prior to the employee(s) first day on site.

Riggers shall meet the qualified rigger requirements of subpart CC – Cranes and Derricks in Construction, as specified in 29 CFR 1926.1401, 1926.1404, and 1926.1425. These provisions are effective November 8, 2010. The more stringent rule shall apply.

Operators shall meet the qualified operator requirements found in 29 CFR 1926.1427. The operator has been licensed by an approved agency or union and meet the requirements in Chapter 5, ANSI B30 and the operator has passed their physical exam conducted by a license Physician approved by the DOT.

Fall Protection

Work activities that expose worker(s) to fall hazards of six (6) feet or greater measured from the work platform to the bottom of the sole of the foot are activities defined by Webcor/Obayashi Joint Venture to be High Hazard and therefore require detailed, written Job Hazard Analysis (JHA). Webcor/Obayashi Joint Venture maintains a zero tolerance policy for fall protection infractions. Anyone found violating this policy may be removed from the site immediately. All trade subcontractors shall provide appropriate fall protection at the Companies cost.

Possible conditions that may require fall protection:

- Ladders
- Aerial Lifts / Scissor Lifts
- Scaffold work
- Precast erection
- Unprotected Sides & Edges / Leading edges
- Excavations & Trenching
- Wall Openings
- Holes

Trade subcontractor are required to provide training and fall protection for their employees. This can be accomplished through the use of the following systems:

- Guardrail System
- Positioning Device System
- Warning Line System
- Personal Fall Arrest system
- Safety Net System
- Controlled Access Zone

The building perimeter cable is placed as a guardrail protection, and is not provided for tie-off protection.

Webcor/Obayashi Joint Venture does not allow the use of body belts or a Safety Monitor System.

Fall Protection Training

Trade subcontractors and tiered subcontractors must provide, as a minimum, by a competent person, the following training. Documentation of training must be forwarded to Webcor/Obayashi Joint Venture upon request:

- The nature of the fall hazards in the work area.
- The correct procedure for erecting, maintaining, disassembling and inspecting the fall protection systems to be used.
- The use and operations of guardrail systems, personal fall arrest systems, safety net systems, warning line systems, controlled access zones and any other methods of protection to be used.
- The limitations on the use of mechanical equipment.
- The correct procedures for the handling and storage of equipment and materials
- The erection of overhead protection.
- The role of workers in rescue plans.

Rail Systems

A standard railing should consist of a top rail, intermediate/mid-rail, toe board and posts. The top rail should be approximately 42 inches from the upper surface of the rail to the floor, platform, or ramp level. The top rail should have a smooth surface throughout its length and be made of at least 2-inch by 4-inch

stock, 3/8-inch double clamped wire rope or its equivalent. It should be secured to withstand a 200-pound, horizontal force with minimum deflection.

The midrail should be halfway between the top rail and the floor, runway, platform, or ramp. The ends of the rail should not overhang the terminal posts except when it does not constitute a projection hazard. The midrail sill should be made of at least 1-inch by 6-inch stock or its equivalent.

The toe board should have a 4-inch minimum height and should be securely fastened in place with no more than 1/4 inch clearance above the floor level.

Wooden railing posts (verticals) should be made of at least 2-inch by 4-inch stock or its equivalent, and be spaced so as not to exceed 8 feet on center.

Other types, sizes and arrangements of railing construction are acceptable, provided they meet the following requirements. Have a smooth surfaced top rail approximately 42 inches above the floor, strength to withstand the minimum of 200 pound top rail pressure with a minimum of deflection and for specific material requirements, refer to applicable regulations.

Guard Rail Openings

Work that requires the opening of guardrails or the removal of hole covers shall be approved in advance by the Webcor/Obayashi Joint Venture Project Management. Particular attention shall be given to the alternate means of fall protection required to safely perform the work and protect other workers in the vicinity of the fall exposure. Those who remove the rail, are responsible for replacing it in a manner meeting or exceeding local, state, federal, or Webcor/Obayashi Joint Venture practices, whichever may be more stringent.

Floor & Wall Openings

To control conditions where there is a danger of workers or materials falling through floor, roof, perimeter edges or wall openings, such openings shall be securely covered and/or protected, capable of withstand 2x the load, be secured to the floor and shall be inspected daily by the trade subcontractor competent person. Trade subcontractor's Competent Person is responsible for identifying any floor opening or hole requiring to be protected. Covers should be clearly marked "Hole Do Not Remove" in a high visible color and anchored.

For purposes of covering, a floor opening is defined as any opening from 2" up to 16 square feet. All others must be protected with top and intermediate rail and toe board. All protection systems are to be maintained at all times. Any violation that is not rectified immediately will result in removal of the responsible Supervisor. Further violations will result in termination for cause of the responsible subcontractor's contract.

The building perimeter, shafts, and floor openings shall be protected with guard rails and toe boards. Personnel working at a stationary position within 6'-0" of the building perimeter or the edge of a shaft or a floor opening will wear a full body harness and be tied off with an appropriate lifeline. Trade subcontractors and tiered subcontractors shall not remove any guard rail or fall protection device without the express consent of Webcor/Obayashi Joint Venture. Any employee removing such protection without authorization will be removed from the project without recourse. Any area where guardrails and toe boards have been removed shall not be left unattended during a shift. In no case will any guardrail or toe board be left down at the end of a shift.

In locations where temporary protection conflicts with scheduled construction, the trade subcontractor or the tiered subcontractor shall notify Webcor/Obayashi Joint Venture in advance of the work of necessary modifications. The trade subcontractor or the tired subcontractor shall remove the temporary protection and provide other appropriate temporary measures for the performance of their work.

Personal Fall Arrest Systems
Personal fall arrest systems are designed to control the fall of a worker and minimize the injury once a worker has fallen. Personal fall arrest systems consist of a full body harness, a shock absorbing lanyard or retractable, and a tie off point.

General Fall Protection

- Any safety harness, lifeline or lanyard actually subjected to in-service loading must be immediately removed from service and should not be used again for worker safeguarding
- Fall arrest equipment should be removed from service when evidence of wear is detected.
- All safety harnesses, lifelines and lanyards must have a nominal breaking strength of 5,000 lbs (5,400 lbs in CA).
- All fall protection equipment shall be inspected daily/monthly and before each use, with documentation made available upon request that it is in proper working order.
- Body Harness
    -
- Lanyards
    - Retractable lifelines are preferred where direct anchorage is not available.
    -
    - All lanyards must be equipped with locking snap hooks.
    - Appropriate shock absorbing lanyards will be used for fall protection when they do not create a greater hazard due to the length of the potential fall.
    - Shock absorbing lanyards are not to be used in combination with a retractable lanyard.
- Anchorage point
    - The anchorage (tie off point) must be capable of withstanding a minimum 5,000 lbs (5,400 lbs in CA) tensile strength per worker attached.
    - Anchorage used for attachment of personal fall arrest equipment should be secured above the point of operation whenever possible
        - Anchorage, tie off, must generally be above the worker's head.
    - Anchorage must be high enough that the worker will not strike any lower level surface or object should a fall occur.

Safety Nets
The use of safety nets may be allowed only after a written fall protection plan, limited to the actual work to be performed, is reviewed and approved by Webcor/Obayashi Joint Venture. Safety nets should be provided by the trade subcontractor or tiered subcontractor when work places are more than 25 feet above the ground or other surfaces where the use of ladders, scaffolds, catch platforms, temporary floors, safety lines or safety harnesses are impractical. When safety net protection is required, operations should not be undertaken until the net is in place and has been thoroughly tested.

Safety nets should extend 8 feet beyond the edge of the work surfaces where workers are exposed and should be installed as close under the work surface as practical. In no case should the safety net be more

than 25 feet below the work surface. Nets should be hung with sufficient clearance to prevent the user's contact with surfaces or structures below. Clearances should be determined by impact load testing. The mesh size of the nets should not exceed six (6) inches by six (6) inches. All nets should meet accepted standards of 17,500 foot pounds minimum impact resistance, as determined and certified by the manufacturer, and should bear a label of proof test. Edge ropes should have a minimum breaking strength of 5,000 pounds. Forged steel safety hooks or shackles should be used to fasten the net to its supports. Connections between net panels should develop the full strength of the net.

Rescue Plans
Specific plans for rescue of worker(s) should be developed and rehearsed prior to initiating work requiring the use of fall protection. Rescue plans and the basic work plan should be submitted to the Webcor/Obayashi Joint Venture Project Management and SSM for review and comment. Concerns expressed by Webcor/Obayashi Joint Venture Project Management and SSM or any other reviewing authority shall be addressed fully prior to exposing any worker to the elevated work area.

Falling Object Protection Systems
Anytime a potential hazard of falling objects exists, suitable systems must be provided to protect workers. Examples of suitable fall object protection systems may include covers, toe boards, canopies and debris nets. Proper barricading shall encompass the entire possible target area.

Ladders
All ladders shall be inspected prior to use and used for its intended purpose.

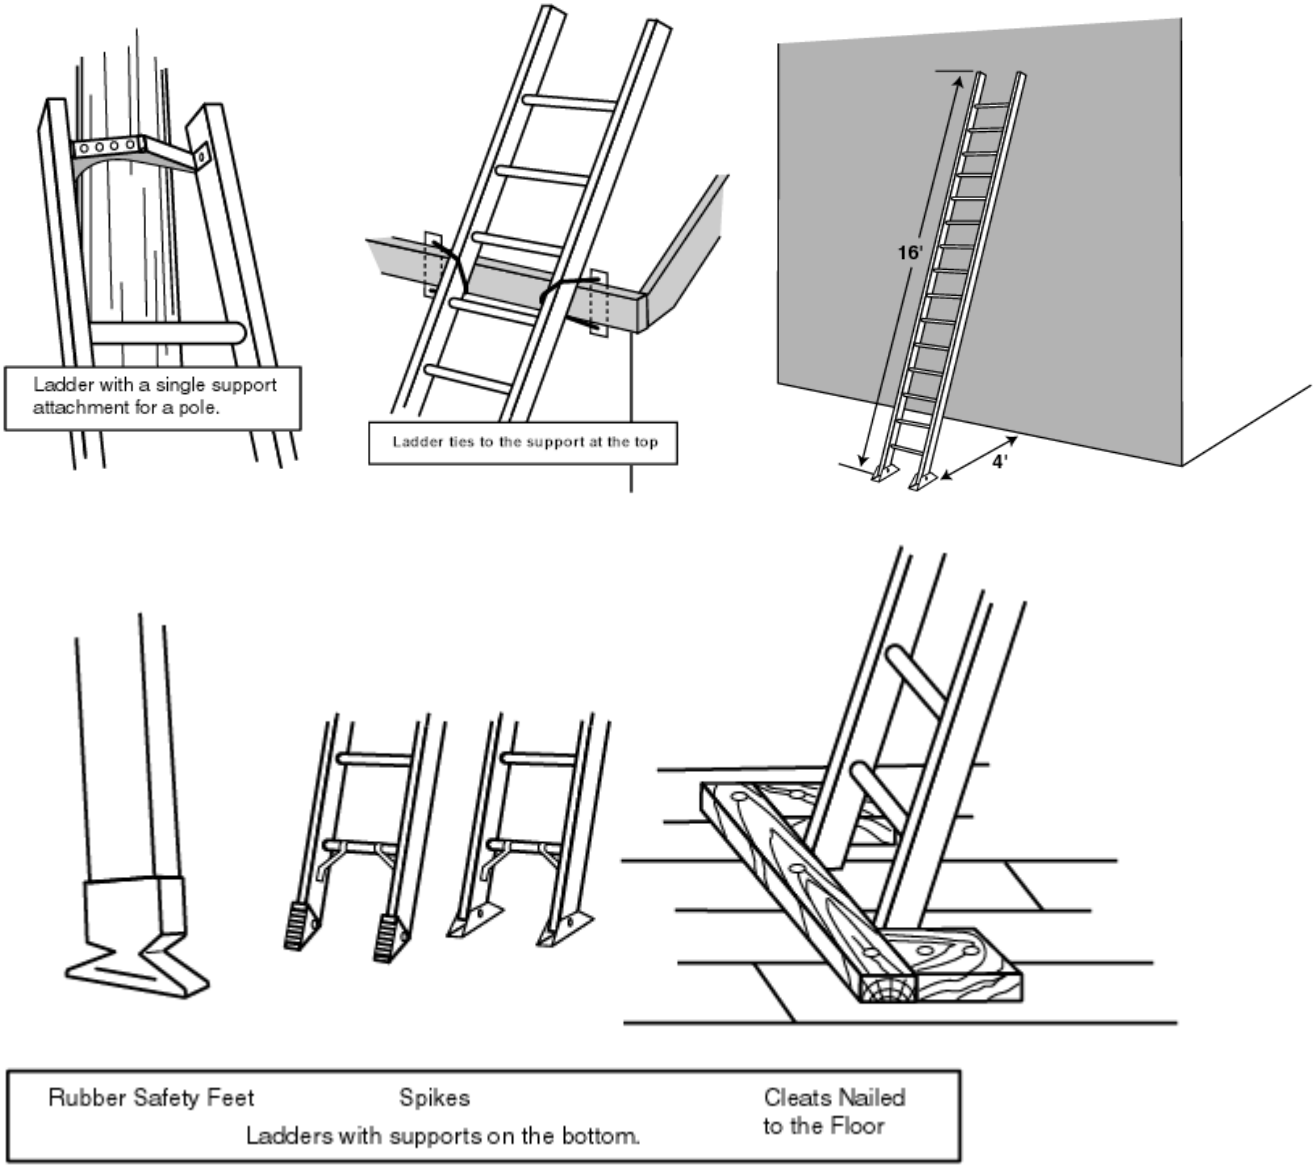
General Ladder Safety
- When ascending or descending a ladder, employees shall maintain three-points of contact and not carry anything that could cause them to fall. Pull ropes should be placed at all access ladders to lift tools or equipment from level to level.
- As a minimum, only type 1 or 1-A Heavy/Extra Heavy duty ladders, which carry a minimum of 275 lbs. to 300 lbs., will be allowed on Webcor/Obayashi Joint Venture projects.
- Metal ladders shall not be used on Webcor/Obayashi Joint Venture projects.
- Fall prevention shall be considered by the competent person if an employee works from a ladder 6’ or more above a lower level.
- Ladders are not to be painted except for numbering purposes.
- Do not use ladders for skids, braces, workbenches, or any purpose other than climbing.
- Always face the ladder when ascending and descending.
- If you must place a ladder over a doorway, barricade the door to prevent its use and post a warning sign.
- Only one person is allowed on a ladder at a time.
- Do not jump from a ladder when descending.
- All joints between steps, rungs, and side rails must be tight.
- Safety feet must be in good working order and in place.
- Rungs must be free of grease and/or oil.
- Portable ladders must be used at such a pitch that the horizontal distance from the top support to the foot of the ladder is about one-quarter of the working length of the ladder.
- All ladders must be equipped with safety (non-skid) feet.

Stepladders

- Do not place tools or materials on the steps or platform of a stepladder.
- Do not use the top two steps of a stepladder as a step or stand.
- Always level all four feet and lock spreaders in place.
- Do not use a stepladder as a straight ladder.

Straight type or extension ladders

- All straight or extension ladders must extend at least three (3) feet beyond the supporting object when used as an access to an elevated work area.
- After raising the extension portion of a two or more stage ladder to the desired height, check to ensure that the safety dogs or latches are engaged.
- All extension or straight ladders must be secured or tied off at the top and bottom.



Scaffolds

All scaffolds shall be constructed and maintained so as to meet all safety requirements of Cal/OSHA and Webcor/Obayashi Joint Venture. Failure to maintain scaffolds in good condition will result in removal by Webcor/Obayashi Joint Venture. All scaffolds must have top rails, mid rails, and toe boards at all platform levels. All scaffolds are to be built under the supervision of a competent person. The person's name and their qualifications shall be submitted in writing to Webcor/Obayashi Joint Venture prior to the start of work. Daily pre-shift inspection checklists shall be performed by a competent person, maintained by the trade subcontractor, available to all who access the scaffold and submitted to Webcor/Obayashi Joint Venture upon request.

A competent person shall determine if it is feasible to use fall protection devices while erecting /dismantling a scaffold. 100% fall protection is required at all heights above 6'. Rolling scaffold wheels shall be locked when in use. A horizontal, diagonal brace shall be in place to prevent the scaffold from "wracking". Cross bracing shall not be used as a top or mid rail.

Aerial Lifts

Only authorized persons should operate an aerial lift, and must be trained on the equipment they will be operating. A spotter may be needed when there is a potential for operator injury due to physical contact with facility systems or structures or in congested areas. Spotters may also be needed when there is a potential for damage to sensitive facility systems or structures.

Lifts should be inspected each day prior to use to verify they are in safe working condition. Any lift that does not meet inspection guidelines shall be removed from service and either returned, replaced, or modified to meet requirements. Boom and basket load limits specified by the manufacture should not be exceeded. The brakes should be locked and when outriggers are used, they should be positioned on pads or a solid surface. Wheel chocks must be used before using an aerial lift on an incline provided they can be safely installed. Aerial lifts should have both upper and lower controls. Upper controls should be in or beside the platform within easy reach of the operator. Lower controls should provide for overriding the upper controls. Controls should be plainly marked as to their function. Lower level controls should not be operated unless permission has been obtained from the employee in the lift, except in case of emergency.

Always stand on the floor of the basket, do not sit or climb on the edge of the basket or use planks, ladders, or other devices for a work position. A body harness should be worn and a shock absorbing lanyard attached to the boom or basket when working from an aerial lift. Tying off only to recommended anchorage points.

An aerial lift truck should not be moved when the boom is elevated with personnel in the basket.

Scissor Lifts

Lifts should be inspected each day prior to use to determine that they are in safe working condition. Only authorized persons should operate a scissor lift, and must be trained on the equipment they will be operating. Lifts should be operated in accordance with manufacturer's recommendations. Any lift that does not meet the required inspection guidelines shall immediately be removed from service and either returned, replaced, or modified to meet this requirement. A spotter may be needed when there is a potential for operator injury due to physical contact with facility systems or structures and in congested areas. Spotters may also be needed when there is a potential for damage to sensitive facility systems or structures.

Electrical

Ground Fault Circuit Interrupter (GFCI) protection is required for all electrical cords and tools. Each trade subcontractor shall provide GFCI protected power strips for use on the site when permanent power has been energized and permanent outlets are placed in service. Each trade subcontractor shall be responsible for providing and maintaining temporary GFCI's for their employees if a GFCI receptacle is not available.

Lockout/Tag out Procedures (LOTO)

Subcontractors shall submit their written LOTO program and documented employee training prior to beginning LOTO procedures. The program must include scope of training, pre-planning and specific LOTO procedures. All individuals who are working in or around the hazardous energy shall place their own lock and tag on the disconnect switch of the energy source. At no time will someone be allowed to remove another employee's lock unless it has been cleared through Webcor/Obayashi Joint Venture Competent Supervision.

Powder Actuated Tools

Only low-velocity-type tools will be allowed on this project. Special permission from Webcor/Obayashi Joint Venture must be obtained before high-velocity types can be used, and then only if the job requires it. All personnel working with powder-actuated tools shall be property instructed and licensed for operation of the tool and shall be in possession of current certification while using powder-actuated tools. Hearing protection signs, ear plugs and warning signs shall be posted in the work area where powder-actuated tools are in use.

Heat Illness Prevention

Heat related illnesses are avoidable if the employees are trained and the right actions are taken before, during, and after working in either indoor or outdoor hot conditions. High temperatures, humidity, air velocity and radiant heat from the sun or a furnace can stress the body's ability to cool itself making heat illness a big concern during hot weather months. These would be considered environmental risk factors. Every employee whose job duties require them to work in the outdoors during summer months, are exposed to elevated heat conditions and therefore are susceptible to heat illness.

The three major forms of heat illnesses are: heat cramps, heat exhaustion, and heat stroke. Heat stroke can be a life threatening condition. This document will outline those actions as well as describing the three major forms of heat illness, how to recognize them, and what an action to take to provide first aid before medical care is provided. If an employee is experience heat related illness notify their Supervisor and Webcor/Obayashi Joint Venture SSM immediately.

Heat Cramps

Heat cramps are the most common type of heat related injury and probably have been experienced by nearly everyone at one time or another. Heat cramps are muscle spasms which usually affect the arms, legs, or stomach. Frequently they do not occur until sometime later after work, at night, or when relaxing. Heat cramps are caused by heavy sweating, especially when water is not replaced quickly enough. Although heat cramps can be quite painful; they usually don't result in permanent damage.

Prevention/First Aid:

Drink electrolyte solutions such as Gatorade or plenty of water during the day and try eating more fruits such as bananas to help keep your body hydrated during hot weather. Call 911 and contact your supervisor immediately if the Person becomes ill.

Heat Exhaustion
Heat exhaustion is more serious than heat cramps. It occurs when the body's internal temperature regulating system is overworked, but has not completely shut down. In heat exhaustion, the surface blood vessels and capillaries, which originally enlarged to cool the blood, collapse from loss of body fluids and necessary minerals. this happens when you do not drink enough fluids to replace what you are sweating away symptoms Include: Headache, heavy sweating, intense thirst, dizziness, fatigue, loss of coordination, nausea, impaired judgment, loss of appetite, hyperventilation, tingling in hands or feet, Anxiety, cool moist skin, weak and rapid pulse (120-200), and low to normal blood.

Prevention/First Aid**:**
The employee suffering these symptoms should be moved to a cool location such as a shaded area or air-conditioned building. Have them lie down with their feet slightly elevated. Loosen their clothing, apply cool, wet clothes or fan them. Have them drink water or electrolyte drinks. Try to cool them down, and have them checked by medical personnel. Victims of heat exhaustion should avoid strenuous activity for at least a day, and they should continue to drink water to replace lost body fluids. Call 911 if the person becomes non-responsive, refuses water, vomits, or loses consciousness.

Heat Stroke
Heat stroke is a life threatening illness with a high death rate. It occurs when the body has depleted its supply of water and salt, and the victim's core body temperature rises to deadly levels. A heat stroke victim may first suffer heat cramps and/or heat exhaustion before progressing into the heat stroke stage, but this is not always the case. It should be noted that, on the job, heat stroke is sometimes mistaken for a heart attack. It is therefore very important to be able to recognize the signs and symptoms of heat stroke and to check for them anytime an employee collapses while working in a hot environment. Symptoms of heat stroke include: A high body temperature (103 degrees F); a distinct absence of sweating (usually); hot red or flushed dry skin; rapid pulse; difficulty breathing; constricted pupils; any/all the signs or symptoms of heat exhaustion such as dizziness, headache, nausea, vomiting, or confusion, and possibly more severe systems including; bizarre behavior; and high blood pressure. Advance symptoms may be seizure or convulsions, collapse, loss of consciousness and a body temperature of over 108 degrees F.

Prevention/First Aid**:**
It is vital to lower a heat stroke victim's body temperature. Quick actions can mean the difference between life and death. Pour water on them, fan them, or apply cold packs. Call 911 to get the person medical aid as soon as possible.

Guidelines for Preventing Heat Illness
If an employee is coming back to work from an illness or an extended break or is just starting a job working in the heat, it is important to be aware that they are more vulnerable to heat stress until their body has time to adjust. The employee needs to let their Supervisor know they are not used to the heat. It takes about five (5) to seven (7) days for a body to adjust. Drinking plenty of water frequently is vital to workers exposed to the heat. An individual may produce as much as two (2) to three (3) gallons of sweat per day. In order to replenish that fluid the worker should drink three (3) to four (4) cups of water every hour starting at the beginning of your shift. Taking breaks in a cool shaded area and allowing time for recovery from the heat during the day are effective ways to avoid heat illness. Avoid or limit the use of

alcohol and caffeine during periods of extreme heat, both dehydrate the body. Whenever possible wear clothing that provides protection from the sun but allows airflow to the body. Protect your head and shade your eyes if working outdoors.

During the designated warmer months of the year (April through September) all jobsites are required to incorporate heat illness prevention and awareness training into the Tailgate Safety Meetings. Training documentation shall be submitted to Webcor/Obayashi Joint Venture SSM. Shade and plenty of water shall be provided in sufficient amount to each and every employee. Emergency services must be called when an employee(s) experience a heat related illness

Drinking Water
Trade subcontractors shall provide potable drinking water, cups, and trash receptacles for their employees. All trash receptacles shall be properly emptied on a daily basis.

Use of Tools and Equipment

Each trade subcontractor is responsible to provide proper instructions for their employee's use of all tools and equipment. When the use of portable electric or pneumatic tools is needed, proper safety guards must be in place and operational. Power tool cord "whips" must meet NEC requirements. Air compressor hoses must be "clipped" together and tools are not to be raised or lowered by their cords or air hoses.

Hazardous Material

This Section will conform to Specification Sections 01 13 50 (1.4B and C) and (1.8D) found in The Transbay Transit Center Contract Number 08-04-CMGC-000

Currently Webcor/Obayashi Joint Venture does not anticipate, based on the scope of work, to have any excavations that will require special protection. In the event the situation does arise, The Trade Subcontractor will submit all appropriate documentation (protections, support systems, inspection process, access) preceding the activity.

Hazardous Communications Program
All subcontractors are to comply with Webcor/Obayashi Joint Venture's Hazard Communication Standard Policy.

If an employee is allergic to cement, or may be susceptible to lime burns, or skin disorders ensure that employees Supervisor is aware and do not assign that employee to tasks associated with those irritants. If an employee is allergic to or cannot use any other chemicals there Supervisor must be notified.

Hazard Communication Standard Policy

This Section will conform to Specification Sections 01 15 45 (1.2A1, 1.2A2),(1.13D),(1.4A), (1.4C) found in The Transbay Transit Center Contract Number 08-04-CMGC-000

The TJPA will not review the HASP for its content, nor will the TJPA be liable for Contractor's failure to have an adequate HASP or implement it. Receipt of the HASP by the TJPA neither constitutes the legality of the HASP nor incurs liability with Trade Sub contractor. Noncompliance with this portion of the Webcor/Obayashi Joint Venture Safety Policy will be written up as a Safety violation and may result in a

Safety fine and/or nonpayment to the subcontractor(s). Webcor/Obayashi Joint Venture is only required to train its employees to comply and observe the policy. It is the responsibility of each trade subcontractor and each tiered subcontractor to train their employees in the implementation and use of the Hazard Communication Policy.

Trade Subcontractors shall submit a Health and Safety Plan (HASP) in accordance with this Contract specification. Upon approval of the HASP, Trade Subcontractor shall provide two (2) copies on compact disc in Portable Document Format (PDF) with properly labeled cases. Safety Data Sheet (SDS) (previously known as Materials Safety Data Sheet (MSDS)) for all chemicals and other hazardous materials to be used.

Trade Subcontractors shall submit a site-specific environmental HASP in accordance with these specifications and 29 CFR 1910.120, 8 CCR 5192. The HASP shall remain in effect throughout the life of the Contract, and a copy of the HASP must be on site at all times. Trade subcontractors shall submit five (5) copies of the HASP at least ten (10) working days before any demolition or any building materials-disturbing activity, and no later than thirty (30) days after the Notice to precede for each Trade Subcontract package.

Each subcontractor must submit a copy of its written Hazard Communication Program to the Webcor/Obayashi Joint Venture SSM. An initial hazardous material/chemical listing for this specific jobsite must accompany the written Hazard Communication Program and all trade subcontractors shall maintain their SDS. A complete file of all SDS submitted is to be located at the jobsite office for review by all workers during job hours. Each trade subcontractor will discuss each new substance introduced on the jobsite at the weekly Safety meetings with their crews and the Superintendents of other trade subcontractors at the weekly Subcontractor Meeting. Each trade subcontractor must label the contents of all containers including secondary containers. The label must clearly identify the substance, hazard warnings, the name and address of the manufacturer and the location of the SDS.

Employees are required to be trained in Hazardous Communication, specifically in the dangers of working with these substances, chemicals, materials, required PPE and medical emergency training. Copies of training certificates shall kept on site and be submitted to Webcor/Obayashi Joint Venture SSM.

Bulk fuel storage is not allowed onsite.

Confined Space

No person shall enter a confined space such as manholes, underground vaults, tanks, pipes, tunnels, or other similar places until it is determined that it is safe to enter the space by an approved method. The trade subcontractors Competent Person is responsible for identifying any potential confined space and shall initially determine if a permit required confined space exists. A pre-planning meeting shall be held if a confined space exits and proper procedures shall be followed to ensure worker safety.

When “Hot Work” is performed in Permit Required Confined Spaces, the applicable Standards will be followed for Permit Required Confined Space work.

Equipment

Machinery and equipment shall be inspected and documented daily. Machinery and equipment shall be operated by authorized, trained personnel only. All operated equipment shall have backup alarms in working order. Operators shall inspect each work area to make sure that it is safe to operate the equipment in that area. Equipment shall not be serviced or repaired while it is in motion or running, unless there are appropriate safeguards in place to prevent injury.

Fuel-operated equipment, such as generators, air compressors, welders, etc., shall have a dedicated fire extinguisher near the equipment at all times when it is in operation. Fire extinguisher shall be rated as a minimum of 10lb ABC.

Excavation and Trenching

Currently Webcor/Obayashi Joint Venture does not anticipate based on the scope of work to have any excavations that will require special protection. In the event the situation does arise, The Trade Subcontractor will submit all appropriate documentation (protections, support systems, inspection process, access) preceding the activity.

This Section will conform to Specification Sections 00 07 00 (I), 00 08 14(1.2B), 00 08 14(1.4), 00 08 14(1.5B) and 01 35 65 (1.7C) found in The Transbay Transit Center Contract Number 08-04-CMGC-000

Pursuant to section 6705 of the California Labor Code, excavation for trenches five (5) feet or more in depth shall not begin until Webcor/Obayashi Joint Venture has received acceptance from the TJPA of Webcor/Obayashi Joint Venture detailed plan for worker protection from the hazards of cave-in's during excavation of such trenches. Webcor/Obayashi Joint Venture shoring plan shall be submitted in accordance with the requirements of the Specifications and shall show the details and supporting calculations of the design of shoring, bracing, sloping, or other provisions to be made for worker protection during such excavation. No plan shall allow the use of shoring, sloping or other protective system less effective than that required by the Construction Safety Orders of the Division of Occupational Safety and Health. If Webcor/Obayashi Joint Venture shoring plan varies from the shoring system standards established by the Construction Safety Orders, the plan shall be prepared and sealed by an engineer retained by Webcor/Obayashi Joint Venture who is registered as a civil or structural engineer in the State of California. The TJPA acceptance of Webcor/Obayashi Joint Venture shoring plan shall not be construed to relieve Webcor/Obayashi Joint Venture of its responsibility for damage or injuries related to the excavation resulting from unsafe shoring.

The trade subcontractor will comply with all requirements of Federal OSHA, Cal/OSHA, the California Labor Code, Trade Subcontractor safety requirements, and these Contract Documents. The more stringent requirements shall apply. Prior to commence of earthwork activities the trade subcontractor shall review their safety procedures. Trade subcontractors shall submit for approval a comprehensive and site specific Health and Safety Plan (HASP) prepared by a certified Industrial Hygienist. A health and safety plan shall be certified by the trade subcontractor's Competent Hazardous Materials Supervisor and submitted to the TJPA for review and comment prior to implementation. Daily, pre-shift inspection of excavations, the adjacent areas and protective systems shall be made by the Competent Person for evidence of potential cave-ins, hazardous atmospheres or protective system failure. Daily, pre-shift inspection checklists shall be maintained by the subcontractor and submitted to Webcor/Obayashi Joint Venture weekly. No person shall enter an excavation where protection from ground movement is required until such protection is in place. 100% fall prevention and/or protection is required when working next to excavations greater than

five feet (5') in depth. Ladders or other means of approved access shall be used for all excavations. Stepladders shall not be used in a "leaning" position to enter or exit excavations.

Should trade subcontractors be notified by the TJPA of any unsafe or unhealthy condition associated with the performance of the Work and be required to take remedial action to correct such conditions, trade subcontractors shall take action immediately, if so directed, or within 48 hours after receipt of a notice of violation.

Respiratory Protection

Conditions may exist which require the utilization of respiratory equipment to protect employees against exposure to the inhalation of toxic or harmful gasses, vapors, mists, fumes and dust. Each Contractor must implement and enforce a written respiratory program in accordance with CAL/OSHA standards to protect employees from these types of exposures. Trade subcontracts written Respirator Protection programs shall be submitted to Webcor/Obayashi Joint Venture prior to use of respirators.

Only respirators that are applicable and suitable for the purpose intended shall be used. Respirators and cartridges shall be selected on the basis of the hazards to which the employee may be exposed to. Respiratory protective equipment shall be inspected regularly and maintained in good condition. Cartridges shall be replaced per manufacturer's recommended or calculated filter change-out schedule so as to provide complete protection. Respiratory protective equipment, which has been previously used, shall be cleaned and disinfected before it is issued to another employee.

Dust respirators are to be replaced in accordance with manufacturer specifications.

Employee shall be medically evaluated, Fit Tested and properly trained prior to using a respirator. A copy of the employee's medical approval will be kept on site by their employer. Every employee who wears a respirator must be clean-shaven to ensure the proper fitting of the respirator

Concrete Code of Safe Practices

The Concrete Code of Safe Practices is established to assist in conforming to the requirements for all construction activities involving concrete performed on Webcor/Obayashi Joint Venture projects. This includes, but is not limited to cast in place, shoring & reshoring, formwork/false work, post tensioning, placing & finishing.

Definitions

Bull float - a tool used to spread out and smooth concrete.

Formwork - the total system of support for freshly placed or partially cured concrete, including the mold or sheeting (form) that is in contact with the concrete as well as all supporting members including shores, reshores, hardware, braces, and related hardware.

Limited access zone - an area alongside a masonry wall, which is under construction and which is clearly demarcated to limit access by employees.

Precast concrete - concrete members (such as walls, panels, slabs, columns, and beams) which have been formed, cast, and cured prior to final placement in a structure.

Reshoring - construction operation in which shoring equipment (also called reshores or reshoring equipment) is placed, as the original forms and shores are removed, in order to support partially cured concrete and construction loads.

Shore - a supporting member that resists a compressive force imposed by a load.

Fall Protection – Concrete Specific

- Workers working more than six (6) feet above any adjacent working surface or placing reinforcing steel in walls, piers, columns, etc. should be protected by personal fall arrest system, guardrail system or equivalent device.
- Workers inside a Cunningham beam for, where the form leading edge is less than 39" in height and the worker is greater than 6' above a lower working surface, should be protected by a suitable fall protection system consisting of a catenary or similar pendant type line and personal fall arrest system.
- As soon as practical, a perimeter guardrail system should be established.
- Special attention and consideration should be given to workers on ladders within 6' of leading edge such as when working on columns or wall forms. Additional fall protection measures may be required.
- When working on vertical reinforcing steel columns or false work, fall protection should be set in advance from ladders, manually propelled elevated work platforms, or similar means so that 100% fall protection can be utilized.
- Workers on wall forms greater than six (6) feet above any adjacent working surface should be protected from falling by a personal fall arrest system or equivalent system. Ensure appropriate anchorage points are provided and utilized. Where applicable, a two (2) hook system for 100% fall protection should be utilized.
- Workers who are placing or tying reinforcing steel more than six (6) feet above any adjacent working surface should be protected from falling by personal fall arrest system or equivalent system.
- When workers are exposed to falls greater than six (6) feet above any adjacent working surface while erecting or dismantling shoring systems, they should have suitable fall protection as necessary utilize an appropriate anchorage point
- In addition to the above fall protection requirements, when erecting and dismantling shoring, a minimum of two (2) scaffold grade planks should be used or other similar means, such as mobile scaffolding, lifts, etc. Planks should rest on horizontal frame members and not on cross bracing.
- The use of positioning systems as a sole means of fall protection is not permissible.
- Unless otherwise provided by a site specific fall protection plan:
    - The placing of frames and stringers should be from below via appropriate ladders, temporary work platforms, false decks, scaffolds, or other similar work platforms.
    - The first several joists spread should be from below via appropriate ladders, temporary work platforms, false decks, scaffolds, or other similar work platforms. Once the first several joists are positioned, a work platform (e.g. 4x6 sheet of plywood or similar) should be placed on top of a placed joists and all further spreading of joists should take place from this work platform or successive sheets of plywood laid to extend this platform. Work should take place from the center of the bay, with joists spaced no greater than 24" on center. Any work within 6' of the leading edge and greater than 6' above a lower working surface should be protected by a suitable fall protection system.

Formwork/False work

Formwork, false work and shoring should be designed, fabricated, erected, supported, braced and maintained so that it will be capable of supporting without failure all vertical and lateral loads that may reasonably be anticipated to be applied to the formwork. Formwork which is designed, fabricated, erected, supported, braced and maintained in conformance with ANSI A10.9-1983 Construction and Demolition Operations – concrete and masonry work, will be deemed to meet the requirements of this paragraph.

- Drawings or plans, including all revisions, for the jack layout, formwork including shoring equipment, working decks, and scaffolds, should be available at the jobsite.
- Procedures for safe installation, removal, lifting etc., should be available at the jobsite and all workers appropriately trained in these procedures as applicable.
- Work areas should be clear of all unauthorized personnel during installation, concrete placement and removal. Appropriate barricading, delineation and/or signage should be placed to limit access and alert other workers of hazards associated with the work area.
- At no time should workers place themselves underneath a live load.
- When hoisting material, the worker should be positioned to the side of the hoisted material and never into the pinch point between the hoisting equipment and the material or in the area where an operator would land material in the event of an emergency.
- Appropriate tag lines should be utilized as required and two (2) tag lines may be necessary to help align/control panels or forms.
- Safe means of access and egress should be maintained at all times.

Removal of Formwork

Forms and shores (except those used for slabs on grade and slip forms) should not be remove until the employer determines that the concrete has gained sufficient strength to support its weight and superimposed loads. Such determination should be based on compliance with one of the following:

- The plans and specifications stipulate conditions for removal of forms and shores, and such conditions have been followed, or the concrete has been properly tested with an appropriate ASTM standard test method designed to indicate the concrete compressive strength, and the test results indicate that the concrete has gained sufficient strength to support its weight and superimposed loads.
- Prior to dismantling, the entire system should be inspected to determine if there are any hazards from displacement, weakening, alterations etc. of the shoring and false work.
- Shores, cross braces etc. should only be removed in the immediate work areas and as appropriate.
- All nails should be removed or bent over immediately upon stripping.
- Shoring, formwork and all other equipment being removed should be stacked, consolidated or placed in an orderly manner as soon as practicable during the removal operation and egress/access paths maintained at all times.
- Only appropriate tools should be used for removal of shoring and formwork.

Shoring and Reshoring

- All shoring and reshoring operations should comply with all federal, state local and manufactures regulations.
- All shoring equipment (including equipment used in reshoring operations) should be inspected prior to erection to determine that the equipment meets the requirements specified in the formwork drawings.

- Shoring equipment found to be damaged, severely rusted, missing locking devices etc. should not be used for shoring. Shoring equipment that is in place and is found to be damaged or weakened, should be immediately reinforced.
- Erected shoring equipment should be inspected immediately prior to, during and immediately after concrete placement.
- The sills for shoring should be sound, rigid and capable of carrying the maximum intended load.
- Base plates should be attached to a minimum of 12' square, 2" plywood or equivalent.
- All base plates, shore heads, extension devices, and adjustment screws should be in firm contact, and secured when necessary, with the foundation and the form.
- Existing ground should be level, adequately compacted and loads distributed. Consideration should be given to adverse weather conditions such as washouts, rain impact to slopes etc. Special precautions such as hardwood wedges or bracing should be utilized on sloped surfaces.
- All clamps, screws, pins and other similar components should be in a closed or engaged position.
- Eccentric loads on shore heads and similar members are prohibited unless these members have been designed for such loading.
    - Ensure stringers are centered on these members to minimize eccentric loading.
- Adequate access should be provided to all form deck surfaces.
- When horizontal shoring is required, these should be engineered and special consideration should be given to installation and conformance to the completed design.
- Ensure all stringers and joists are fully supported and centered over shoring heads/top plates and adequately secured. Further, ensure that all stringers and joists are fully upright and not rolled.
- All horizontal shoring should be installed and erected in compliance with manufacture's requirements as well as federal, state and local regulations.

Frame Shoring

- The design of the shoring should be prepared by a qualified designer and the erected shoring should be inspected by an engineer qualified in structural design.
- The shoring design or layout drawing should be followed with no omissions of required components, or alteration in frame spacing's, types used, towers heights, locations or sizes.
- Shoring loads should be carried on all legs.
- All shoring fames should be plumb and level. This should be checked and corrected at a minimum of during erection and just prior to the pour.
- Adjustment of shoring frames should not be made once the pour begins.
- When shoring height exceeds a minimum of four (4) times the minimum base width, additional bracing and securing of the frames should be performed.
- Cross braces should never be climbed, workers should climb frames from the inside.

Screw Jacks

Screw jacks should not exceed the manufactures recommended extension height at any time. Screw jack extension should be kept to a minimum for maximum load carrying capacity. All screw jacks should be in firm contact with the foundation and frame legs.

Post Shoring

- The single post shores should be vertically aligned/plumbed.
    - This should be checked and corrected at a minimum of during erection and just prior to the pour.

- Adjustment of post shores for any reason should not be made once the pour begins.
- Refer to the manufacture's guidelines for additional stability measures and bracing requirements of each system used.
- Post shores should be adequately secured at top and bottom to prevent displacement.
- Whenever single post shores are used one on top of the other (tiered), they should comply with the following specific guidelines in addition to the general guidelines for formwork:
    - The single post shores should be spliced to prevent misalignment.
    - The single post shores should be adequately braced in two (2) mutually perpendicular directions at the splice level.
    - Each tier should also be diagonally braced in the same two (2) directions.

Ellis Shores

- Ensure shores are erected with the proper length of timbers allowing a minimum of 24" overlap between shore members.
- The shore clamps should be attached 12" apart with the upper clam at a minimum of 2" from the top of the lower shore. Each clamp should be secured with the appropriate number of type of duplex nails.
- Shores should be raised to the desired height by sliding the upper shore member upwards being careful to avoid pinch points.
- Shore hand jacks should not be used to raise decks, lift formwork or elevate concrete.
- Ensure all shores, jacks and clamps are inspected prior to use and any damaged or defective materials are removed or repaired prior to use.
- Safety nails should be secured above each clamp of the upper shore member casting to prevent uplift or movement during vibration.

Re-shoring

- Shores should not be removed, including cross bracing, until the concrete has gained sufficient strength to support its weight and superimposed loads. Such determination shall be based on compliance with one of the following:
- The plans and specifications stipulate conditions for removal of forms and shores, and such conditions have been followed or the concrete has been properly tested with an appropriate ASTM standard test method designed to indicate the concrete compressive strength, and test results indicate that the concrete has gained sufficient strength to support its weight and superimposed loads.
- Stripping and removal of shoring equipment should be performed in conformance to the approved stripping sequencing plan.
- Re-shoring should be erected, as the original forms and shores are removed, whenever the concrete is required to support loads in excess of its capacity.
- The design of the shoring should be prepared by a qualified designer and the erected shoring should be inspected by an engineer qualified in structural design.
- The shoring design or layout drawing should be followed with no omissions of required components, or alterations in spacing's, types used, heights, locations or sizes.
- Re-shores should be placed directly below load carrying legs to avoid punch through, stress reversals or other undesirable forces on the poured concrete.
- Slabs or beams should be allowed to take their permanent deflection before final adjustment of re-shoring equipment is made.
- Horizontal shoring should never be used as part of a re-shoring system.

Bracket Scaffolds

- Bracket scaffolds should only be used through bolted walls, with at least 5/8" diameter bolts.
- Scaffolds should be solidly secured to the walls or the supporting structure.
- Scaffolds should be able to support at least four (4) times the maximum intended working load.
- Spacing of brackets should not be greater than 10' apart.
- Railings should be installed on all scaffolds 6' or greater in height.
- Platforms should consist of at least two 2"x10" planks that extend at least 6" over each bracket and no more than 18".
- Platforms should be solidly planked with no more than 7" gap under the back rail and 14" gap to the face of the form.
- Planking should be scaffold grade lumber or equivalent and should be free from damage, defects, cracks, splits etc. Damaged planks should not be used.

Reinforcing Steel

All protruding reinforcing steel, onto and into which employees could fall, should be guarded to eliminate the hazard of impalement. When working at grade, impalement hazards from 4" to 6' in height, at a minimum, should be protected. Reinforcing steel for walls, piers, columns, and similar vertical structures should be adequately supported to prevent overturning and to prevent collapse. Employers should take measures to prevent unrolled wire mesh form recoiling. Such measures may include by are not limited to securing each end of the roll or turning over the roll. Reinforcing steel should be stockpiled as close as practicable to work areas. Additionally special attention should be taken towards access and egress to work areas, excavations and ensuring work areas are free from tripping hazards or other surface encumbrances.

Concrete Placement and Finishing

Appropriate PPE should be utilized during concrete placement and finishing. This includes but is not limited to safety glasses, fall protection, gloves, boots, hardhat, and long sleeves. Appropriate respiratory protection should be used for all concrete cutting, grinding, sanding, and blasting, dry mixing, jack hammering etc.

The following should be observed while working with concrete:

- When discharging concrete on a slope, the wheels of ready-mix trucks should be blocked, the brakes set to prevent movement and the operator with the vehicle at all times.
- All washout activities should be completed in the designated washout area.
- All concrete cutting, finishing and cleanup should be done in such a manner that all residue or waste water will be properly contained and disposed of.
- Appropriate precautions should be taken for specialty applications (e.g. acid washing, dyes, stains etc.); in their handling, storage use and disposal.
- Powered and rotating type concrete troweling machines that are manually guided should be equipped with a control switch that will automatically shut off the power whenever the hands of the operator are removed from the equipment handles.
- Bull float handles used where they might contact energized electrical conductors, should be constructed of nonconductive material or insulated with nonconductive sheath that's electrical and mechanical characteristics provide the equivalent protection of a handle constructed of nonconductive material.

- Masonry saws should be guarded with a semicircular enclosure over the blade.
- When operation air guns for cleaning off decks, inside forms etc., these guns should have a maximum of 30 psi nozzle pressure and be equipped with a safety release valve.
- Air guns should have pressure valves, and extension tube and the hoses well maintained with appropriate whip checks.
- Employee operating air guns should have appropriate PPE, including but not limited to, chip protection (i.e. face shield, goggles etc.), ear plugs and respiratory protection as required.
- No employee should be permitted to perform maintenance or repair activity on equipment (such as compressors mixers, screens, pumps used for concrete and masonry construction activities) where the inadvertent operation of the equipment could occur and cause injury, unless all potentially hazardous energy sources have been locked out and tagged.

Concrete Buckets

No employee shall be permitted to ride concrete buckets or work under concrete buckets while buckets are being elevated or lowered into position. Elevated concrete buckets shall be routed so that no employee or the fewest number of employees are exposed to the hazards associated with falling concrete or falling buckets. Concrete buckets equipped with hydraulic or pneumatic gates should have positive safety latches or similar safety devices installed to prevent premature or accidental dumping. Concrete buckets should be designed to prevent concrete from hanging up on top of the sides.

Pump-Crete Systems

Concrete pumping systems using discharge pipes should be provided with pipe supports designed for 100% overload. Compressed air hoses used on concrete pumping systems should be provided with positive failsafe joint connectors to prevent separation of sections when pressurized. Movement of concrete hoses should be planned to limit the amount of manual positioning of hose as much as practicable. When necessary, the use of hooks, ropes or other similar devices should be utilized when handling the concrete hose.

Buggies & Wheelbarrows

Concrete buggy handles should not extend beyond the wheels on either side of the buggy. Handles should be guarded or equipped with knuckle guards. All buggies, wheelbarrows or other similar conveyances should be properly maintained and repaired/replaced immediately if damaged, in poor repair or otherwise. Paths of access and travel should be level, free of debris and other surface encumbrances and ramps or other access ways should be appropriately built, maintained, and protected. Buggies, wheelbarrows etc. should not be overloaded.

Post-Tensioning Operations

No employee (except those essential to the post-tensioning operations) should be permitted to be behind the jack during post-tensioning operations. Signs and barriers should be erected to limit employee access to the post-tensioning area during tensioning operations. Appropriate fire protection measures should be taken during burning operations, including by not limited to spark control or blankets, fire extinguishers, wetting formwork etc.

Permitting/Documentation

Before a contractor is on site, the following items should be obtained in writing. A permit for excavation/trenching activities (Cal OSHA Excavation Notification Form as applicable) for all trenches/excavations that are equal to or greater than 5’ in depth where an employee is required to enter as

well as a permit for any false work or scaffolding 36' in height or greater total. Excavation and trenching plan, shoring/false work design or plan needs to also be submitted to Webcor/Obayashi Joint Venture in writing. Name(s) of competent person(s), soils analysis report and a copy of the trade subcontractor's safety manual are also required prior to work.

General Rigging Equipment Safety:

Inspect rigging equipment for material handling prior to use on each shift and as necessary during its use to ensure that it is safe. Remove defective rigging equipment from service.
Never load rigging equipment in excess of its recommended safe working load.
Remove rigging equipment when not in use from the immediate work area so as not to present a hazard to employees.
Mark special rigging accessories (i.e., spreader bars, grabs, hooks, clamps, etc.) or other lifting accessories with the rated capacity. Proof tests all components to 125% of the rated load prior to the first use. Maintain permanent records on the job site for all special rigging accessories.

Asbestos Abatement Program

Products that contain Asbestos can be helpful, but they can also be very harmful. Asbestos is a mineral which has many positive qualities. It is fireproof, heat resistant, lightweight, resistant to most chemicals, sound-absorbing and it does not conduct electricity. Asbestos has been used to mix with plaster and wallboard for strength and support, sprayed onto wall, ceilings, and steel girders for fireproofing, wrapped around pipes, boilers and heating ducts for insulation, in floor and ceiling tiles among others. Asbestos can break down into tiny fibers, like grains of sand or rope and can float in the air for long periods of time, allowing them to be easily inhaled. A powerful microscope is needed to see the fibers since they are invisible to the human eye, they have the strength of steel, and one cannot taste or smell them. Asbestos material that a worker may encounter generally fit into two (2) categories: Friable and Non-Friable. Friable asbestos is air born, thin, easily damaged or broken asbestos and is most dangerous to human's respiratory system. Non-friable is asbestos that is not damaged, a complete piece. The three most common materials that contain asbestos are thermal system insulation, floor tiles and sprayed-on materials. Thermal system insulation is the most common type of friable asbestos material, and can be found on boilers, utility pipes, ductwork and heating systems.

This Asbestos Abatement Program is developed to inform workers who don't really work directly with asbestos, but who may have incidental exposure, must receive at least "Asbestos Awareness" training. To help address OSHA's concerns, and provide the awareness training needed by employees under the regulation, employees shall be trained, understand monitoring activates and how to protect against potential asbestos exposure. Employees should understand how long-term exposure to asbestos can harm the human body as well as understand how to avoid potentially hazardous maintenance and custodial activities that could lead to asbestos exposure since custodians, engineers and maintenance workers have the highest chance of exposure to asbestos. Employees should understand which safe work practices should be used when helping with a minor asbestos clean-up and understand why and when there is a potential for exposure to asbestos. Air monitoring and medical surveillance can be important elements in providing a safer workplace.

Exposure to asbestos fibers can lead to a disease known as "Mesothelioma." Mesothelioma is a chronic disease, occurs over time. There is rarely acute side effects when a worker is exposed to asbestos. Symptoms of asbestos exposure may include shortness of breath, enlargement of the heart, scaring of the

lungs, cancer and death. People who smoke are especially vulnerable to Asbestos. Cigarette smoke breaks down the lungs' defensive system, and leaves them vulnerable to Asbestos fibers. Smokers are over 50 times more likely to become sick after long-term exposure to Asbestos.

While working with material that has or potentially has asbestos requires safe handling and proper PPE. Even a small tear in asbestos material can cause serious harm. If an employee suspects a piece of asbestos material is damaged their supervisor shall be notified immediately and secure measures shall be taken to ensure minimal exposure. These measure may include securing the material in a plastic bag secured with duct tape and wetting down the immediate area to ensure the material does not become friable.

Proper PPE

Although asbestos is not a skin contact hazard, by wearing disposable overalls helps reduce the potential of transferring asbestos from the work area to non-contaminated areas.

A respirator and designated filters shall be required to reduce the potential of introducing asbestos fibers into the lungs. A fit test and medical evaluation shall be conducted prior to an employee donning a respirator. The respirator must be the right size and securely fit a clean shaved face. Respirators shall be cleaned and stored as recommended by an Industrial Hygienist.

An Air Sampling Device may, at times, be worn by the employee to measure airborne concentrations of asbestos in the work are. The Air Sampling Device varies in design and appearance, however does include an air pump located near the employees face and a sampling cassette that is secured onto the employee. An Industrial Hygienist will instruct the employee in further details regarding the use of an Air Sampling Device.

Medical Surveillance

A Medical Surveillance program is put in place to monitor employees since asbestos causes chronic illnesses. The program tests the workers lung capacity and x-rays the chest cavity and lungs for any previous damage and to record current conditions. The worker may be asked to return for continued surveying depending on their potential exposure. The Medical Surveillance costs are that of the employer, free service to the employee.

Clean up Methods

The Asbestos Awareness Program is designed to make workers aware of the health hazards, locations and minor cleanup of asbestos, this program does not include Asbestos Work. Large quantities of asbestos required more detail and training than what is provided here. However, if a minor cleanup or containment is required follow these basic steps:

- Proper PPE: respirator, gloves, Tyvek body suit. Don and Done PPE properly
- Appropriate work area: the contaminated area is guarded with access available through the decontaminated area and final access to the non-contaminated area.
- Equipment: wet methods, HEPA vacuum shall be used. Low Abrasion Pad, at speeds less than 300rmp are acceptable.
    - Do not sweep or shovel material contain asbestos.
- Disposal
    - Asbestos materials must be properly bagged and labeled.
        - Use only official Asbestos Disposal Bags.
        - Use a Generator Label which lists the name and address of your facility.

- If an Asbestos Disposal Bag becomes torn, double bag and seal it immediately with tape.
- Asbestos is a regulated waste (it must be hauled to a licensed landfill).

Decontamination

After any work with Asbestos materials, workers must decontaminate themselves and their equipment. This prevents the spread of Asbestos dust and debris. Always use an official decontamination area that is equipped with a HEPA vacuum, as well as a plastic drop cloth (to contain any loose fibers). Never eat, drink or smoke in these decontamination areas, or any other area where asbestos is present. Scrub hands and face with soap and water before leaving work. If possible, shower before leaving your facility as well, if not, instruct the worker to shower immediately when they get home to prevent potential exposure to others. When decontaminating clothing, never brush off dust or debris because asbestos fibers may become airborne. Use a HEPA vacuum to remove materials from clothing before taking it off. Also vacuum equipment and Asbestos Disposal Bags. Tyvek suits will need to be disposed of in an Asbestos Disposal Bag and disposed of as regulated waste.

Lead Abatement Program

This program has been put in place because Webcor/Obayashi Joint Venture recognizes that some of the work we do has the potential to expose our employees to lead. We want to do as much as is practically possible to protect them from lead exposure.

Prior to the start of a project, professionals/Industrial Hygienist in lead detection and abatement will be brought in to do an Exposure Assessment to determine whether the work environments Webcor/Obayashi Joint Venture employees will be operating in has the potential to expose workers to lead. These professionals will be used to give Webcor/Obayashi Joint Venture direction as to how to proceed. It will be our goal to have lead abatement taken care of by licensed lead abatement professionals prior to the arrival of Webcor/Obayashi Joint Venture employees.

Lead can be found in a number of workplace environments. Until recently, lead was a common component in paints of all kinds (which can create exposure whenever sanding, sandblasting, scraping, or even demolition occurs).

Workplace experience and empirical studies have shown that lead is fairly easily absorbed into the body. Breathing airborne lead dust and fumes is the most common route of entry. Lead can also be absorbed if it comes into contact with the mouth or tongue.

Overexposure to lead can occur both on an acute basis, where large amounts of lead are absorbed into the body in a short period of time, or on a chronic basis where small amounts of lead are absorbed at any one time, for a long period eventually accumulating to cause significant health problems.

On May 4, 1993, OSHA published the Interim Final Rule for Lead Exposure in Construction. The Construction Standard establishes “Interim” procedures and work practices that must be followed in construction environments. The OSHA Standard and its compliance requirements are included at the end of this written program. The Lead Standards are “performance based”; the standard will tell you what you have to accomplish.

A General Requirement in the Lead Standards states employers must make sure that no employee is exposed to lead concentrations greater than 50 micrograms per cubic meter of air, averaged over an eight-hour period in any 24-hour day.

Typically, OSHA requires that you use the following methods to protect your employees through engineering controls, work-practice controls, respiratory protection, PPE, hygiene facilities and practices, housekeeping and employee information and training.

OSHA requires that every employer who is covered by these Standards provide information and training. For employers in the Construction Industry, it requires that they meet the training requirements of the Hazard Communication Standard. Information that must be given employees under the Hazard Communication Standard includes the hazards associated with lead exposure, warning signs and labels that can be found on materials containing lead, and how to find information about materials containing lead on Safety Data Sheet (SDS), and use of PPE.

Respiratory Protection Program

The purpose of this plan is to establish a program and procedures for wearing respiratory protection at the Transbay Transit Center. This program supports compliance with the Occupational Safety and Health Administration Respiratory Protection Standard as found in 29 CFR 1910.134. This program applies to all company employees who work in areas whose exposures to airborne contaminants require the use of respirators.

Definitions

Dusts: Particles released during work operations such as grinding and sawing.

Fit Testing: The process of making sure that an employee's respirator fits property and will provide the necessary protection without any leaks.

Fumes: Vaporized, condensed metals such as lead that may be present during welding operations.

Gases: Examples include nitrogen, methane, and carbon monoxide.

IDLH: An OSHA hazard classification: Immediately Dangerous to Life & Health. An atmospheric condition that poses an immediate hazard to life or poses immediate irreversible debilitating effects on health.

Mists: Particles of liquid released during operations such as spray painting.

NIOSH: National Institute for Occupational Safety and Health; an agency that establishes minimum performance standards for respirators and tests and approves respirators for various uses.

Vapors: Gaseous forms of a liquid such as paint solvents.

Responsibilities

Program Administrator

The Program Administrator is responsible for issuing and administering this program and making sure that the program satisfies the requirements of all applicable federal, state, or local respiratory protection requirements. Providing initial and periodic training to employees on respiratory protection requirements. Conducting hazard assessments where respiratory hazards may be present. Assisting managers and supervisors in the selection of appropriate respiratory protection for use on their jobsites.
Auditing the respiratory protection program to ensure its continued effectiveness.

Purchasing Agent

The Purchasing Agent will be the Jobsite Superintendent and is responsible for purchasing respiratory protection equipment and assuring that all equipment purchased is approved by NIOSH/MSHA.

Superintendent

Superintendents whose jobsites are required to wear respiratory equipment is responsible for knowing the hazards in their areas that require respiratory protection, knowing the types of respirators that need to be used, enforcing the wearing of respiratory protection in the areas where it is required, making sure employees are knowledgeable about the respiratory requirements for the areas in which they work and providing training on hazardous chemicals to employees.

Employees

Employees who are required to wear respirator protections is responsible for wearing appropriate respiratory protection, properly maintaining their respiratory protection equipment and keeping it in a clean and operable condition and notifying their Supervisor of any additional hazards.

Program Activities

Respiratory hazards will be assessed on the jobsite and appropriate protection will be provided for all affected employees. Employees are required to wear respiratory protection wherever respiratory hazards exist. Respiratory protection is stored and issued from the jobsite office. Efforts will be made to minimize the use of hazardous chemicals in the workplace. If the use of hazardous chemicals creates an imminent-danger situation, the operation will be discontinued.

Respirators

Respirators will be selected according to the type of activity for which they will be used and the type of potential air contaminants associated with these activities. Only NIOSH/MSHA approved respirators will be used. All respirator protection equipment will be used in accordance with the manufacturer's recommendations. In areas in which maintenance and sanitation services are unavailable or respiratory usage is limited, disposable respirators will be used. Non-disposable respirators which are used exclusively by one person will be maintained and cared for by the wearer. All non-disposable respirators which are used by more than one person will be cleaned and sanitized between each use. Chemical cartridge respirators will be stored in airtight, labeled containers between each use. All other respirators will be stored in a clean and sanitary manner and labeled with the wearer's name. Disposable respirators will be used until the cartridge or filter media requires replacement or when the face piece is dirty.

Respirators will be inspected by the wearer prior to each use. Supervisors on jobsites where respirators are used will verify that appropriate respirator protection is being used, inspected, and maintained properly. Non disposable respirators will be inspected according to the manufacturer's instructions.

All users of respirators will be fit tested to ensure a proper face piece-to-face seal. Employees whose facial hair interferes with the face piece-to-face seal will not be allowed to wear negative-pressure air-purifying respirators.

All employees who are required to wear respirators will receive training in their use, selection and appropriate maintenance. Training will provide an opportunity for the employee to handle the respirator, have it fitted property, test the face piece-to-face seal, wear it in normal air, and wear it in a test atmosphere.

Silica Exposure Program

The purpose of this policy is to establish procedures to protect employees from the health hazards associated with exposure to airborne crystalline silica generated by various construction activities. Due to the amount of work we do with concrete and masonry on almost any project; our workers have the potential for silica exposures through abrasive blasting, chipping, hammering, sawing, grinding or demolition of concrete.

Silicosis is a lung disease marked by hardening of lung tissue and symptoms such as shortness of breath, possible fever, fatigue and eventual respiratory failure. Silicosis also renders a person more susceptible to disease of the lungs, such as tuberculosis. Where there is concrete, there is a potential silica exposure so it is essential to monitor our work activities and take the necessary corrective actions to protect our employees.

Responsibilities

Supervisor

Project Supervision shall evaluate all work activities for silica exposures, institute engineering controls as a first line of protection to reduce silica exposures, institute all administrative/work practice controls to reduce silica exposures when feasible and when engineering controls have been explored and ruled out. Institute the use of respirators to reduce exposures when the above mentioned controls fail to reduce silica exposure levels, provide training identified in this policy when employees are exposed to silica hazards and provide necessary respirator protection as well as training in its proper use, when deemed necessary.

Employees

The workers shall follow all work plans that identify engineering and administrative work practice controls to reduce their exposure to crystalline silica. They will wear respiratory protection to reduce their exposure to crystalline silica when deemed necessary by their supervisor and not eat, drink, use tobacco products or apply cosmetics in areas where there is dust containing crystalline silica.

Program Activities

Crystalline silica exposures must be maintained below the OSHA PEL of 10mg/m3 Percentage Quartz) +2. Historical data from similar operations producing silica exposure can be used as exposure monitoring when feasible. Assessment of worker exposure to reparable crystalline silica dust during various tasks associated with concrete finishing and demolition activities is performed annually by an Industrial Hygienist. Specific job tasks monitored include grinding, patching, chipping, demolition, segregation, stockpile, and loading of concrete rubble.

When it has been determined that employees will be exposed to crystalline silica in excess of the PEL, engineering controls will be used as a first line of defense. Engineering controls include, but are not limited to the use of dust collection systems which are available for many dust generating tools and equipment, using wet methods to keep dust particles down, use abrasives with a low silica or no silica content or using local exhaust ventilation to prevent dust from being released into the air. When engineering controls cannot be utilized or are not effective to sufficiently reduce exposure to the inhalation of silica, administrative controls will be used when feasible to reduce the time of exposure for the employees where work crews are of sufficient size, the pool of workers skilled in the operation of applicable tools, and job duration is sufficient to accommodate worker rotation, develop a program to reduce the exposure time of individual workers to silica.
Work tasks that must be monitored for crystalline silica exposure include by are not limited to:

- Jack hammering and chipping
- Grinding concrete
- Tunneling
- Sandblasting
- Dry sweeping or blowing concrete debris, sand or rock dust
- Demolition of concrete/masonry structures
- Crushing, loading, dumping rock or concrete
- Saw cutting concrete or rock

Respirators

Respirators will be selected according to the type of activity for which they will be used and the type of potential air contaminants associated with these activities. Only NIOSH/MSHA approved respirators will be used. All respirator protection equipment will be used in accordance with the manufacturer's recommendations. In areas in which maintenance and sanitation services are unavailable or respiratory usage is limited, disposable respirators will be used. Non-disposable respirators which are used exclusively by one person will be maintained and cared for by the wearer. All non-disposable respirators which are used by more than one person will be cleaned and sanitized between each use. Chemical cartridge respirators will be stored in airtight, labeled containers between each use. All other respirators will be stored in a clean and sanitary manner and labeled with the wearer's name. Disposable respirators will be used until the cartridge or filter media requires replacement or when the face piece is dirty.

Respirators will be inspected by the wearer prior to each use. Supervisors on jobsites where respirators are used will verify that appropriate respirator protection is being used, inspected, and maintained properly. Non disposable respirators will be inspected according to the manufacturer's instructions.

All users of respirators will be fit tested to ensure a proper face piece-to-face seal. Employees whose facial hair interferes with the face piece-to-face seal will not be allowed to wear negative-pressure air-purifying respirators.

All employees who are required to wear respirators will receive training in their use, selection and appropriate maintenance. Training will provide an opportunity for the employee to handle the respirator, have it fitted property, test the face piece-to-face seal, wear it in normal air, and wear it in a test atmosphere.

Select respirators based on the criteria identified in the respirator protection section of this manual.

Air Monitoring

After the initial assessment and institution of exposure controls, follow-up air monitoring will be conducted to assess the effectiveness of the controls put in place. In the event that the follow-up monitoring reflects that instituted controls have not yet reduced employee exposures, the operations will cease, be re-evaluated and alternative controls will be explored to reduce employee exposures to silica.

Training

Employees will be trained in the hazards of silica exposure, engineering and administrative/work practice controls, if any, that have been instituted to control silica exposures and PPE.

WEBCOR/OBAYASHI JOINT VENTURE
CONTRACTOR QUALITY CONTROL PLAN
TRANSBAY TRANSIT CENTER PROJECT

This Webcor/Obayashi JV Contractor Quality Control Plan will be developed incrementally as the trade packages are awarded and trade subcontractors are brought on board. Each trade subcontractors QC plan will become part of the Webcor/Obayashi JV's overall Contractor's Quality Control Plan and will be submitted to the Transbay Joint Power Authority as they are received.

1.0 ELEMENT 1 ***MANAGEMENT RESPONSIBILITY***

1.1 INTRODUCTION PLAN

1.2 FEDERAL TRANSIT ADMINISTRATION GUIDELINES

1.3 MANAGEMENT RESPONSIBILITY

1.4 PROJECT EXECUTIVE QUALITY RESPONSIBILITY

1.5 CQC ORGANIZATION CHART

1.0 MANAGEMENT RESPONSIBILITY

1.1 INTRODUCTION PLAN

Project quality is the responsibility of all members of the project team and starts at the highest level of management. This Quality Control Management Plan details the specific processes by which the Project's quality will be managed and forms the basis upon which Webcor/Obayashi JV will ensure that all quality policy requirements for the Transbay Transit Center are compliant, maintained and continually being evaluated and improved. This Plan integrates the quality management process into the Webcor/Obayashi JV organizational structure and construction management systems.

Key elements of this plan include:

- The commitment of the Webcor/Obayashi JV Senior management to delivering a project that meets the Transbay Transit Center Quality Management System Manual.
- Accepted project specific construction management policies, procedures and tools for the control of project information and the management of the construction documents, submittals and the work of the trade subcontractors.
- A Webcor/Obayashi JV project-specific quality plan that meets the TJPA and FTA quality requirements and contract requirements.
- Trade Subcontractor, site specific, quality plans that meet TJPA and FTA quality requirements and contract requirements.
- Consistent CQC staff oversight- the Webcor/Obayashi JV CQC Manager and the Trade Subcontractors CQC Managers will have a physical presence on site when work is in progress.

1.2 FEDERAL TRANSIT ADMINISTRATION GUIDELINES

The Webcor/Obayashi JV Contractor Quality Control Plan incorporates all 15 Essential Elements of the Federal Transit Administrations Quality Assurance and Quality Control Guidelines dated December 2012 as appropriate for Webcor/Obayashi's scope of work:

1. *Management responsibility*
2. *Documented quality management system*

3. *Design control*
4. *Document control*
5. *Purchasing*
6. *Product identification and traceability*
7. *Process control*
8. *Inspection and testing*
9. *Inspection, measuring and test equipment*
10. *Inspection, test and operating status*
11. *Nonconformance*
12. *Corrective action*
13. *Quality records*
14. *Quality audits*
15. *Training*

1.3 MANAGEMENT RESPONSIBILITIES

Webcor/Obayashi JV fully integrates this quality management plan into the organizational structure and performance management systems of the project.

- Maintain and follow a documented Quality System consisting of this Site Specific Quality Manual with policies and procedures.
- Establish and implement project management procedures.
- Maintain Quality System documents and records.

1.4 PROJECT EXECUTIVE QUALITY RESPONSIBILITIES

The Project Executive of Webcor/Obayashi JV is the one person in the company ultimately responsible for quality control function. Regardless of other duties, quality responsibilities of the Project Executive include:

- Empower the Webcor/Obayashi JV Transbay Transit Center CQC Manager to perform the CQC duties described in the contract documents.
- Oversee the projects quality plan and objectives.
- Ensure the availability of necessary resources and information for effective operation of the CQC System.
- Provide active oversight of the Trade Contractors Quality Control Plans

2.0 ELEMENT 2 DOCUMENTED QUALITY MANAGEMENT SYSTEM

WO0000-011400WO1.10

2.0 DOCUMENT QUALITY MANAGEMENT SYSTEM

2.1 INTRODUCTION

Webcor/Obayashi JV is responsible for developing and maintaining attached written procedures and instructions regularly for activities affecting quality in design, procurement manufacturing and construction as applicable to the work performed. This will include implementing documentation of this Contractor Quality Control Plan and their assuring that Trade Subcontractors prepare, implement document trade package specific QC Plans. Webcor /Obayashi JV CQC Field Specialists will provide day to day oversight of the CQC System to assure Trade Subcontractor work conforms to the requirements of Transbay Transit Center Contract Documents and this Webcor/Obayashi JV CQC Plan.

Webcor/Obayashi JV will direct Trade Subcontractors to execute their CQC plans and maintain compliance with all project requirements as described in the Contract Documents. Contracts with Trade Subcontractors and Sub-tier Subcontractors shall include a requirement to comply with the provisions of this Plan, and to prepare and execute QC plans appropriate for their scope of work. The Trade Subcontractors, Sub-tier Subcontractors are authorized to manage their own QC Plans. All subcontractors, QC Managers, field personnel assigned to that work at the site shall conform to contract including the requirements described in this CQC Plan and their trade package specific QC Plans.

2.2 CQC OVERVIEW

Quality Control Written procedures and instructions have been developed for activities affecting quality in design, procurement, manufacturing, and construction as applicable to the work performed. Procedures and instructions have been developed for control of processes including inspection, testing, nondestructive examination, disposition of nonconforming product, corrective action, maintenance of quality records, quality audits, and training.

The procedures contain a statement of the purpose and scope, and contain any references to appropriate codes, standards, or specifications. In developing the quality approved and futrue procedures, consideration has be given to identifying and acquiring any inspection equipment, skills, or special quality processes needed to ensure quality performance. Inspection and testing techniques shall be kept up-to-date. Where new techniques are being used for construction or manufacturing, adequate time shall be allowed to develop appropriate quality procedures for the new techniques. The procedures and instructions shall contain formats for the quality records needed to ensure that the procedures and instructions are followed and documentation requirements are understood.

By providing these guideline to Trade Subcontractors and then meeting with them, along with other key members of the project team, W/OJV will assure that each of the subcontractors, whether large or small would be able to develop a CQC Quality plan that satisfies the requirements of the FTA Guidelines, and consistent from plan to plan.

Offsite Quality Control for Bradken Steel Nodes Casting, Skanska Structural Steel Fabrications, Skylight Glass and other offsite systems fabrication and equipment will be inspected in the shop for quality in coordination with special inspections by our trade subcontractors. This will cover all offsite construction operations as required per contract. This is in addition to Quality Assurance by Turner QA team as TJPA Representative.

2.3 THREE PHASE QUALITY CONTROL SYSTEM

The three phase of control for the Contractor's quality control is the means by which W/OJV, including Trade Subcontractors and supplier ensure that the construction complies with the requirements of the Contract:

PREPARATORY PHASE:

This phase is accomplished prior to beginning work on each definable feature of work, after all required contract submittals, documents, and materials are approved and accepted and after copies are at the work site. This meeting includes:

1. A review of applicable specifications, reference codes, and standards. The Trade Subcontractor QC Manager shall make available during the preparatory inspection a copy of those sections of referenced codes and standards applicable to that portion of the Work to be accomplished in the field. The Trade Subcontractor QC Manager shall maintain and make available in the field for use by TJPA Representative until final acceptance of the Work.
2. Review of the Contract drawings and approved shop drawings (approved as noted shop drawings and record shop drawings) that incorporate all CD details.
3. Identify any submittals that have not been approved.
4. Check to assure that all materials and/or equipment have been pre-tested (if required per specification), submitted, and approved.
5. Review of provisions that have been made to provide required control inspection and testing.
6. Examination of the work area to assure that all required preliminary work has been completed and is in compliance with the Contract.

7. Examination of required materials, equipment, and sample work to assure that they are on hand, conform to approved shop drawings or submitted data, and are properly stored.
8. Review of the appropriate activity hazard analysis to assure environmental requirements are met.
9. Discussion of procedures for controlling quality of the work including repetitive deficiencies. Document construction tolerances and workmanship standards for that feature of work.
10. Check to ensure that the portion of the CQC Plan for the work to be performed has been accepted by the TJPA Representative.
11. Discussion of the initial control phase, set the date, location and scope of activities.
12. Clarification of details may be added as required after work has commenced in the form of RFI's.
13. Review Status of any outstanding RFI's

The TJPA representative shall be notified at least 48 hours in advance of beginning the preparatory control phase. Include a meeting conducted by the CQC System Manager and attended by the Trade Subcontractor's CQC Manager, other CQC personnel (as applicable), and the superintendent responsible for the definable feature of work. CQC System Manager shall document the results of the preparatory phase actions by separate minutes and attach the minutes to the weekly CQC report. CQC System Manager shall instruct applicable workers as to the acceptable level of workmanship required in order to meet Contract requirements (see the "Preparatory Phase Checklist Form" in this section; Tab/Element 7).

INITIAL PHASE:

This phase is accomplished at the beginning of each Definable Feature of Work (at least 1-2 days prior to start of work). This phase includes:

1. Reviewing the minutes of the preparatory meeting and ensuring any open issues have been resolved
2. Verifying the adequacy of controls to ensure full contract compliance, inspection and testing.

3. Establishing level of workmanship and verify that it meets minimum acceptable workmanship standards. Compare with required sample panels as appropriate.
4. Resolving all differences.

The CQC System Manager shall prepare separate minutes of this phase and attach the minutes to the daily CQC report. The TJPA shall be notified at least 72 hours in advance of beginning the initial phase. The initial phase shall be repeated for each new definable feature of work (see the "Initial Phase Checklist Form" in this section; Tab/Element 7). .

FOLLOW-UP PHASE:

CQC System Manager and the Subcontractor QC manager shall perform daily checks to assure that control activities, including control testing, are providing continued compliance with contract requirements until completion of the particular feature of work. Record the checks in the CQC documentation, and file regularly in the appropriate DFOW file folder. Conduct final follow-up checks and correct all deficiencies prior to the start of additional features of work that may be affected by the deficient work. New work shall not be built upon or conceal nonconforming work. Use FCR's on BIM 360 immediately to document deficiencies with materials, installation defects or un-approved shop drawings or products.

2.4 TRADE SUBCONTRACTORS QUALITY CONTROL PLAN

After contract award and prior to beginning construction activities each Trade Subcontractor will submit (per specification section 01 13 00 Submittals, paragraph 1.4) to the Webcor/Obayashi Joint Venture CQC Manager their project specific quality control plan for review and approval. Each Trade Subcontractor will designate and provide a project specific Trade Subcontractor Quality Control Manager who reports to the W/OJV CQC Manager and who's primary responsibility will be to implement and manage the Trade Subcontractor's quality control plan and certify theTrade Subcontractor's compliance with the Webcor/Obayashi Joint Venture Quality Control Plan and all quality control requirements contained in the project documents including specification section 01 14 00 Quality Control. The Trade Subcontractors CQC program will be reviewed for compliance to the Contract Documents. In addition to the requirements contained in other sections of this Plan, the Trade Contractors Quality Control Program will include:

- QC Organization chart.
- Procedures for fabrication and installation.
- Procedures for planning and verifying compliance and controlling quality of the work (including checklist forms).
- Procedures for layout verification.

- Coordination with related contractors.
- List of specified tolerances and workmanship standards for each DFOW.

- Daily CQC Reports.
- Program for identifying and correcting defective work.
- Inspection, test and acceptance procedures when specified in the Technical Specifications to be part of the Trade Subcontractors scope
- A quality control Plan that addressed the Federal Transit Administration (FTA Quality Control Guidelines (ref: Transbay Transit Center Quality Management System Manual)

2.5 WEBCOR/OBAYASHI JV CQC MANAGER DUTIES AND RESPONSIBILITIES

The CQC Manager, or his approved alternate, oversees the overall implementation of the Webcor /Obayashi JV Quality Control Plan. The CQC manager, will be independent of the "production organization". The CQC Manager will:

- During performance of the Work will have complete authority to take any action necessary to ensure conformance with the requirements of the Contract Documents. The Webcor/Obayashi CQC Manager or Alternate CQC Manager will have a physical presence on site when work is in progress. In the event of the CQC Managers absence, the Alternate CQC Manager must be present and will have the same authority as the CQC Manager.
- Review for conformance and completeness and approve the Trade Subcontractors QC Plans prior to submittal to the TJPA for acceptance.
- Manage the development and maintenance of the list of Definable Features of Work.
- Meet with the TJPA representative at the Coordination Meeting (Meeting of Mutual Understanding) for each Trade Work Package.
- Provide WOJV management with monthly CQC updates.
- Ensure and document Trade Subcontractor's application of Three Phases of Control for each Definable Feature of Work.
- Conduct the Preparatory, Initial and Follow-up phase activity meetings.
- Stop and document work that does not comply with requirements of the Contract Documents, and direct removal and replacement of any defective work.
- Ensure and document that all Trade Subcontractor Work performed, on and off the construction site, conforms to requirements of the Contract Documents. Ensure and document that all materials and equipment comply with the

requirements of the Contract Documents. Report any deficiencies and corrective action planned and taken in BIM 360 Systems

- Ensure that all Trade Subcontractors CQC Plans are in conformance with the Webcor /Obayashi JV CQC plan and with the requirements of the Contract Documents.
- Review for conformance, completeness and clarity that all Trade Subcontractors certify their submittals for conformance with the requirements of the Contract Documents.
- Ensure W/O staff document review and approval of submittals prior to transmission to the CMO.
- Review and approve Webcor/Obayashi JV Daily Quality Control reports
- Prepare and submit Weekly Contractor Quality Control reports
- Ensure that all Trade Subcontractors prepare, complete and submit Daily Quality Control reports.
- Maintain copies of all quality control and quality program documents in Constructware.
- Support and facilitate the Audit Process per the QMS and FTA Element 14 (Quality Audits).
- Conduct internal audits
- Ensure that RUP Contractors use preplanning sheets and work plans for improved Quality Control, improved record keeping for M&TE (Measuring and Testing Equipment) and calibration data.
- W/OJV CQC Manager will ensure that CQC team provides a written plan and schedule for resolution of non-conforming work.
- W/OJV CQC team provides a weekly summary and review of CQC activities at the Quality Meeting.

2.6 WEBCOR/OBAYASHI JV ALTERNATE CQC MANAGER DUTIES AND RESPONSIBILITIES

The Alternate CQC Manager performs all duties of the CQC Manager when the CQC Manager is not on-site. The Alternate CQC manager, when performing the duties of the CQC Manager, is independent of the “production organization”. The Alternate CQC Manager’s responsibilities are the same as the CQC Managers

2.7 TRADE SUBCONTRACTORS QC MANAGER DUTIES/RESPONSIBILITIES:

The Trade Subcontractor QC Manager reports to the Webcor /Obayashi JV CQC Manager and oversees the trade specific implementation of the quality control program and whose primary responsibility will be to implement the Trade

Subcontractor's quality control plan. The Trade Subcontractor QC manager will certify that the Trade Subcontractor's work is in compliance with the Contract Documents and complies with the Webcor/Obayashi Joint Venture Quality Control Plan and all quality control requirements contained in the Contract Documents, including specification section 01 14 00 Quality Control. The Trade Subcontractor QC Manager will:

- Manage the Trade Subcontractors Quality Control Program both onsite and offsite.
- Submit a QC Plan that meets the requirements of the Webcor/Obayashi CQC Plan, Specification 01 14 00 Quality Control and the TTC Quality Management System Manual and FTA 15 Essential Elements.
- The Trade Subcontractor QC Manager or alternate QC Manager will have a physical presence on site when work is in progress.
- Designate a qualified Alternate Trade Subcontractor QC Manager to serve in the event of the Trade Subcontractor QC Manager's absence.
- During performance of the Work, will have complete authority to take any action necessary to ensure conformance with the requirements of the Contract Documents.
- Submit daily Quality Control Reports to the Webcor/Obayashi JV CQC Manager.
- Submit Preparatory and Initial Phase Checklists, along with Follow-up Phase documentation for each DFOW to the Webcor/Obayashi JV CQC Manager for review and approval.
- Establish written procedures for Trade Subcontractor document control, submittal management and material procurement.
- Maintain review for conformance and submit copies of all quality control documentation, certifications, and materials delivery receipts as required in the Contract Documents.
- Attend the Coordination meetings (Meeting of Mutual Understanding).
- Manage the Three Phases of Control process for each DFOW, including attending the Preparatory, Initial and Follow-up phase activity meetings for each of the trade subcontractors DFOW.
- Immediately stop any work, for which they are responsible, that does not comply with requirements of the Contract Documents, and direct removal and replacement of any defective work.
- Conduct daily quality inspections of Work performed prior to request for agency or special inspections to ensure compliance with requirements of the Contract Documents.

- Ensure that all Work performed, on and off the construction site, and all materials and equipment conform to requirements of the Contract Documents.

  Report nonconformances and corrective action planned and taken in BIM 360 Systems.

- Remove any person from the Project that consistently fails to perform Work properly.
- Ensure that the Trade Subcontractors submittals conform to the requirements of the Contract Documents.

2.8 QC SPECIALIST RESPONSIBILITIES

In addition to CQC personnel specified elsewhere in the Contract, Contractor shall provide as part of the CQC organization, QC specialists that are specialized personnel to implement the CQC Plan. The QC specialist will:

- Be responsible to the CQC System Manager
- Be physically present at the construction site during work on their areas of responsibility, and have the necessary education and experience.
- These induviduals may perform other duties but must be allowed sufficient time to perform their assigned quality control duties as described in the CQC plan.
- Stop and document work that does not comply with requirement of the Contract documents, and direct removal and replacement of any defective work.

WEBCOR BUILDERS OBAYASHI JOINT VENTURE

CONTRACTOR QUALITY CONTROL MANAGER APPOINTMENT LETTER

To: Adib Sassine
Quality Control Manager

From: Jes Pederson
President / CEO Webcor/Obayashi Joint Venture

Date: October 24, 2013

Subject: Appointment of Quality Control Manager for Transbay Project

---

Please be advised that you are hereby appointed as Quality Control Manager for the Transbay Transit Center Project. Your responsibilities include managing and implementing the Webcor/Obayashi Joint Venture Project Quality Control Plan.

You are assigned the following responsibilities:

- Implementing provisions of the Webcor/Obayashi JV Quality Control Plan as it pertains to the contract Documents.
- Assuring that the Quality Control Plan is established and implemented by persons doing work that impacts quality.
- Assuring that the Quality Control Plan complies to the FTA Guidelines, TJPA Quality Management System and Contract requirements.
- Acting as W/O JV liaison with parties outside of the company on matters relating to quality.
- Reporting to Senior Management on the performance of the Quality Control Plan, including needed improvements.
- Review for conformance, completeness and clarity of the quality control documents.
- Review for conformance, completeness and clarity of quality control records.
- Review for conformance, completeness and clarity of quality related contract submittals.
- Review for conformance, completeness and clarity of project inspection and QC activities.
- Review for conformance, completeness and clarity of subcontractors quality control programs.
- Reporting to the TJPA representative on matters pertaining to quality.
- Reviewing for conformance, completeness, clarity and distributing subcontract QC reports.

I grant you authority for carrying out the above responsibilities including:

- Stopping Work when continuing work may adversely affect quality or cover up a defect.
- To direct the removal and replacement of a nonconforming work or material by any subcontractor or supplier.

President / CEO signature and date: 10/24/13

ALTERNATE QUALITY CONTROL MANAGER APPOINTMENT LETTER

To: Duncan Sinclair
Alternate Quality Control Manager

From: Jes Pederson
President / CEO Webcor/Obayashi Joint Venture

Date: October 24, 2013

Subject: Appointment of Alternate Quality Control Manager for Transbay Project

---

Please be advised that you are hereby appointed as Quality Control Manager for the Transbay Transit Center Project. Your responsibilities include managing and implementing the Webcor/Obayashi Joint Venture Project Quality Control Plan.

You are assigned the following responsibilities:

- Implementing provisions of the Webcor/Obayashi JV Quality Control Plan as it pertains to the contract Documents.
- Assuring that the Quality Control Plan is established and implemented by persons doing work that impacts quality.
- Assuring that the Quality Control Plan complies to the FTA Guideline, TJPA Quality Management System and Contract requirements.
- Acting as W/O JV liaison with parties outside of the company on matters relating to quality.
- Reporting to Senior Management on the performance of the Quality Control Plan, including needed improvements.
- Review for conformance, completeness and clarity of the QC documents with contract documents and approval.
- Review for conformance, completeness and clarity of QC records with contract documents and approval.
- Review for conformance, completeness and clarity of quality related contract submittals with contract documents and approval.
- Review for conformance, completeness and clarity of project inspection and QC activities with contract documents and approval.
- Review for conformance, completeness and clarity of subcontractors quality control programs.
- Reporting to the TJPA representative on matters pertaining to quality with contract documents and approval.
- Reviewing for conformance, completeness, clarity and distributing subcontract QC reports and contract documents an approval.

I grant you authority for carrying out the above responsibilities including:

- Stopping Work when continuing work may adversely affect quality or cover up a defect.
- To direct the removal or replacement of and nonconforming work or material by any subcontractor or supplier.

President / CEO signature and date: 10/24/13

ADIB SASSINE, AIA CA RA

PRECON AND CONSTRUCTION QUALITY CONTROL MANAGER

Design and Construction Experience: 35 years (1978)

Mr. Sassine is a California licensed architect and has over 35 years of strong experience in diverse large project types, including Construction Quality Control, Pre-construction and Construction Management. His extensive experience includes over 25 years of experience on new and renovated health care facilities primarily OSHPD projects; and balance of experience includes; education, schools, office buildings, public buildings, large airports, hotels and restoration of historic buildings.

RELEVANT EXPERIENCE

Building Envelope Sr. Consultant and Architect – Allana Buick & Bers (July 2011 to 7.2013)

Architect and Quality Control Manager on several projects including the following:
New Stanford Hospital over $1 billion; Performed peer review of the entire building envelope over 28 systems. (Rafael Vineolli)
9th and Broadway 17 story tower in San Diego; Design and construction quality control of the building envelope including several green roof areas. (Thornton Tomasetti)
Palo Alto Mitchell Park Library including several systems and green roof; Design of all building envelope and performed construction QC. (Group 4)
San Jose University Student Center, LA Harbor Science Building Design and construction monitoring of exterior envelope composite mock-up testing and similar other including UC Berkeley restorations.
UCSF Parnassus MOB and Hospital forensic work and remediation of two major buildings.
San Mateo Medical Center MOB Exterior skin upgrade design.
And several other projects.

Healthcare

Acute Care Mock-up

Santa Clara Valley Medical Center SCVMC, San Jose, CA – Turner Construction Co (2007 to 2011)

OSHPD – Construction Quality Control Manager on the Bed Building One project which includes the following:

1. A 6 story with Basement and Penthouse nursing tower replacement over 350,000 sf, with 168 beds primarily ICU and Acute Care Units and Rehab Center utilizing SidePlate moment frame system and phased incremental approvals.
2. A 1500 stall Parking Garage with 850 KWp Photovoltaic tracking system over the new garage and retrofit existing Garage for the added solar panel system
3. Design-Build Central Plant upgrade with Site Utilities Loop to include 2-1000 tons absorption chillers, two cooling towers and 2-2000KW generators and two boilers
4. And the Design-Build of Renova Drive intersection relocation
5. Make-ready projects to relocate all underground utilities from the site while the hospital is in operation.

As a QC Manager, Adib is responsible for the construction quality control as well as assisting Purchasing to writing scopes, for all bid packages and reviewing contracts. Some of the quality control responsibilities are to develop the quality control plan and its implementation, pre-inspection of the work before submitting inspection requests by the IOR, reviewing all RFI's, reviewing schedule, reviewing shops and certifying them for compliance with the permitted contract documents, certifying pay applications and certifying milestone completion dates. Adib was involved in providing Pre-construction services such as Sr. Project analyst to provide planning, coordination with all enabling and make-ready projects, scheduling, progress plan check, constructability reviews, report writing and evaluations, phasing plans, cost control and site logistics of the Parking Garage and Solar Power design-build projects and other related hospital projects from Cath Lab to MRI renovation on campus.

CHW St Joseph Women and Children Hospital Stockton, CA ($65M) - Turner

OSHPD – CM at Risk – Pre-construction

Addition of 100,000 sf of 78 beds hospital building with elevated bridge connector and underground parking Garage. Adib provided Constructability Reviews, Site Logistics and Cost Control.

Mills-Peninsula Medical Center Hospital, Burlingame, CA ($400M+) - Turner

OSHPD – CM at Risk – Pre-construction up to NTP

Addition of 440,000 sf six (6) level Hospital designed with base isolation and damper structural systems. Adib provided constructability reviews and purchasing services to include bidding multiple packages, writing scopes and developing bid spread sheets and reviewing all subcontracts for fast-track incremental approvals while project was being reviewed by OSHPD.

Historic Laguna Honda Hospital Seismic Upgrade, San Francisco, CA ($50M) - Turner

OSHPD – CM at Risk – Pre-construction PM

ADIB SASSINE, SR. Project Manager and QC Manager

Adib Managed the project through bidding to include Constructability reviews, phasing, scheduling and budgeting for seismic retrofit of Wing H of the original historic Hospital project and coordination with the new Laguna Honda hospital replacement project.

John Muir Medical Center Hospital Expansion, Walnut Creek, CA ($230M) - Turner
OSHPD – Pre-con services.
Addition of 429,000 sf 5-story tower and remodel of existing regional Trauma hospital including helipad and new Central Plant. Remodel consists of new Emergency Department and phased construction. Provided constructability reviews, phasing plans, cost controls and site logistics.

Lucille Packard Children Hospital Expansion, Palo Alto, CA ($70M) - Turner
OSHPD – Lump Sum – Constructability review during early construction phase.

CPMC Cathedral Hill Hospital Preconstruction, San Francisco, CA ($850 M) - Turner
OSHPD – Delivery Method CM at Risk – Adib provided comprehensive Constructability and Estimate Reviews in the latter part of Turner involvement on the project.
Ground up 550 beds for adults and women/children and 2,745,000 SF Women's and Children's Hospital in downtown San Francisco consisting of 19 stories above ground and 6 stories underground with base isolation. This project included a medical office building design-built with a connecting tunnel under Van Ness.

Sr. PM and Healhcare Business Development – Hathaway Dinwiddie (2004-05)
OSHPD – CM at Risk – during Schematics and DD
Responsible for managing small healthcare projects for Stanford ED and UC Clinical Lab. Adib was responsible to provide BD at Hathaway Dinwiddie. Also Adib managed and bid window replacement on 20 story high rise in Nob Hill in SF and performed cursory constructability review for the Millenium condo tower in SF during early design phase.

Sharp Memorial Hospital, San Diego, CA ($185M) – Gilbane (2000-03)
OSHPD – Project Executive - CM at Risk – during Schematics and DD
This multi-phased project includes the construction of a new six and seven-story, 302 bed patient towers of 315,000 s.f. that include 158 Acute/IMCU beds, 24 SICU/CVICU beds, 64 AC/IMCU beds, 24 CCU/MICU beds, 32 AC/IMCU-Ortho beds and shell space for 32 beds for a total of 334 beds; 14 Operating Rooms and Surgery Suite; New Emergency Department, new Hospital Entrance and Lobby; and administrative spaces. In addition to the new hospital addition, and as part of the SB1953, the Critical Care Areas within the existing hospital will be relocated to the new HMP Addition. This project

also includes the Central Plant Expansion to accommodate new hospital replacement, Coordination with other projects on site such as an Ambulatory Care Center and OSHPD 600 stall parking Garage with Helipad.

UC Davis Medical Center, Sacramento, CA ($260M) - Gilbane

OSHPD – Project Executive Agency CM - This Surgery and Emergency Services Pavilion addition at the UC Davis Medical Center. (During Schematics and DD)
This pavilion is a major addition to the Main Hospital building at UC Davis Medical Center. The project under construction will include approximately 420,000 s.f. of building construction and ten acres of site development. It includes Emergency Department, Dietary Department, Radiology, Cardiology and a 24-room Operating Room suite.

Kaiser Walnut Creek Hospital, Walnut Creek, CA – BFH (1989-96)

OSHPD – Design and Construction Administration - New multi-phase, three-story with full basement, 123 bed Hospital addition and replacement, 10 Operating Rooms, Surgery Suite, MRI Suite, Central Sterile, Clinical Lab, 4 C-Section Rooms, 24 LDR Rooms, ICN and other ancillary spaces. The Hospital was built while maintaining the entire existing hospital in operation on a 28-acre site with covered running creek and heritage Oak trees over 200 years old. Existing building had to be demolished in sections, and existing tower was later renovated and connected to the new Hospital.

Kaiser Walnut Creek Central Plant Expansion, Walnut Creek, *CA – BFH*

OSHPD – Design and CA-This Central Plant Expansion, Medical Gas Farm and Emergency Generator Plant. Project involved 3- 350-ton chillers, switchgear room, boiler room and 3-750KW Generators. Enclosure was adjacent to existing Parking garage with utilities running over creek lid in a high density site.

Kaiser Vallejo Medical Center MOB, Vallejo, CA *($50M)* – SOM (1986-89)

Design and CA - This two-story, 166,645 s.f. Medical Office Building with courtyards to accommodate 123 providers on a 38-acre site with on-site parking built with a connecting site utility loop to CUP.

Kaiser Vallejo Medical Center Central Utility Plant, Vallejo, CA - SOM

OSHPD – Design and CA - This Utility tunnel was added to connect to new Central Plant Expansion. Generator Plant

Kaiser San Rafael Medical Center MOB Renovations, San Rafael, CA *($12M)* - BFH

Design and CA - This 8,000 s.f. project, including OR, ER renovation, pharmacy and radiology renovations over 4-year plan.

Coalinga Community Hospital, Coalinga, CA (LHR)

OSHPD – Design and CA - This 56,000 s.f. project involving 35-bed hospital and 56-bed skilled nursing facility replacements to earthquake-damaged facility. Site is an approximately 12-acre parcel on a new development area.

Office Building

State Office Building at Butterfield Way, Sacramento, CA ($171.5M) - Gilbane

Project Executive - Agency CM - Franchise Tax Board Campus addition and renovation project for the State of California, Department of General Services, and Project Management Branch on this project.

This project involves 1 Million SF of new construction and 843,000 s.f. of renovation on 93 acre site. It is located in Sacramento, California, and consists of phased construction with separate contracts for Sitework, a Central Utility Plant ($25M), a Warehouse, four Building Office complex, and a Town Center. This project was designed to be a LEED certified project.

Wells Fargo Card Division Relocation Center, Concord, CA - BFH

Program Manager and Construction Administrator
Fast-track, 265,000 SF Data Center, with 100% access flooring office space and high security project completed without a single change order for the tenant improvement.

Office and Commercial Historic/Seismic Upgrade

Oakland Rotunda Seismic Upgrade, Oakland, CA ($32M) - AD

Design and CA - This 265,000 s.f. historic building over 100 year old with elliptical dome and seven-story elliptical atrium sustained serious damage during Loma Prieta earthquake in 1989. The brick and steel building had to be retrofitted seismically, including replacing mechanical, plumbing, and electrical systems including provided complete tenant improvements as part of a design-build team. The building has multiple commercial tenants on the first floor and multiple office tenants on the upper floors.

Airports

SFO International Airport, San Francisco, CA ($830M) – Skidmore Owings and Merrill – (1996-98)

Sr. Technical coordinator and Construction Administration as Owner's Rep - Over 1.8 million s.f. of base isolation SFO International Terminal Addition, two five-story office buildings, and light rail, BART station additions and elevated roadway fast-track projects, including coordination with adjacent Boarding Areas A and G. This included VE implementation of over $35 million while project being bid on a fast track delivery model. Adib was also responsible to coordinate with Boarding Areas A and G of two different architectural firms and elevated roadways for total construction cost of$2.3 billion.

Hotels/Convention Centers

Marriott Hotel Tower, Santa Clara, CA ($28M) - *JYA*

Design - This 22-story tower consists of new tower with banquet facilities to accommodate 1,500 persons, a restaurant and conference center. Entire tower was designed as reinforced concrete structure with post tension slab and pre-fabricated EIFS system as the exterior skin.

Original Moscone Convention Center, San Francisco, CA – JA/HOK (1980-83)

CA assistance for the tub design by HOK/IM Pei at 40 feet below Howard and provided punch list for the entire building.

Other Education Facilities

Foothill and De Anza Community Colleges in Los Altos and Cupertino, CA ($275M) - Gilbane

Agency CM - Measure "E" Bond improvements for FHDA. This program consists of new building and

existing building renovations over 60 major projects ranging from $1Million to $33 Million.

University of California at Berkeley, Berkeley, CA - JY
Design - Renovation projects, including Julia Morgan's Hearst Gymnasium, Manville Hall, and Administration renovations.

Duncan J Sinclair
Quality Alternate

EDUCATION AND BACKGROUND

As the Contractor's Alternate Quality Manager when the W/O JV Quality Manager is not on site, Mr. Sinclair will have the primary responsibility of managing the Contractors Quality Management System. His Duties include ensuring Trade Subcontractor compliance with the projects quality requirements via implementation of specified process controls and acting as the day to day interface between project production and quality management to assure the work conforms to the project requirements. He is responsible for documenting quality compliance and providing senior management with periodic quality reports.

Mr. Sinclair graduated with a BS in Mechanical Engineering from Washington State University in Pullman, Washingtonin 1971. Mr. Sinclair alson earned a Masters in Business Administration from City University of Seattle in 1982. His 30 years of contruction management and quality managaement experience includes implementing project-specific quality mangement programs for a variety of construction projects.

LLNL Building HVAC Controls and Electrical Smart Meters. Construction Superintendent for Johnson Controls, Inc. (JCI) to manage field operations installing Electrical Power and HVAC DDC Controls in selective buildings at the Lawrence Livermore National Labs (LLNL) under Contract with Nuclear National Security Agency (NNSA). Duncan managed electricians and HVAC Controls Techs and field verified completeness, assured quality program compliance, Safety Program adherence & housekeeping while performing electrical power meter installations and HVAC DDC modifications and tracking. Daily Work Permits were written by JCI and approved by LLNL. Duncan verified the Work Permit was implemented and notified the JCI QC & LLNL Inspectors to witness the final installation. Public Works; 2010-2011 - 1 year.

Lawrence Livermore National Lab Livermore, CA

Construction Manager for Jacobs Engineering Group assigned to National Ignition Facility Laser CM Team at Lawrence Livermore National Lab to manage various improvements including renovation of an adjacent 3 story office use for $5M lab support facility. Duncan generated all the required Work Permits that includes Safety precautions, specific installation instructions, & Quality management to tie-in MEP Systems to existing Configured Systems under Engineering Management Control. Duncan was responsible for Safety, Facility Access, and interfaced with project QC Inspectors to confirm compliance to Contract Drawings, & Specifications. Coordinated operations with Facility personnel. Public Works; 2009-2010 - 1 year.

Millennium Tower (301 Mission) ***San Francisco, CA***

This project is a high-end condominium/mixed-use project 60 stories tall. It also includes a 12 story condominium/amenity building connected by a 3-level Atrium/Podium. Mechanical, Electrical, Plumbing and Sprinkler (MEPS) Superintendent coordinating MEPS Subcontractors work and quality compliance, $80M Subcontracts. Monitored, updated and planned the Project schedule for 3 week projections. Reviewed Submittals to confirm compliance with Projects Specifications. Inspect all MEPS installations to insure Quality compliance to Specifications. Managed the RFI process to resolve conflicts in drawings or obtain clarifications. Duncan Coordinated Subs to obtain Temporary Certificate of Occupancy with SFPD. Enforce OSHA, Company Safety and Quality Program requirements. $348 million.

St. Regis Museum Tower ***San Francisco, CA***

A five-star, 42-story mixed-use hotel and condominium project with 269 luxury hotel rooms and 102 high-end condominiums.The project also incorporates the renovation of the existing 9-story historic Williams Building, built in 1907. The renovation included a seismic upgrade and the building will house the hotel's restaurant and kitchen as well as a portion of the African American Cultural Museum. MEPS Superintendent coordinating with $80M MEPS Subcontractors, Owners Rep's and project superintendents for Webcor Builders. Duncan monitored, updated and planned the Project schedule for 3 week projections. Reviewed Submittals and field inspected the MEPS installations for Quality compliance. Write RFI's to resolve conflicts in drawings or obtain clarifications. Duncan coordinated Subs to obtain TCO with City Officials. Enforce OSHA and Company Safety Program. $173 million.

Lawrence Livermore National Lab Livermore, CA

Zone Manager for the Laser Bay for a $5M contract for LLNL to install the major components used as the base equipment for the Laser Beams in the National Ignition Facility (NIF). Duncan was the Field Manager for the Subcontractor with 45 craft performing the installation. Duncan was responsible for Quality Control Management to assure exactness of tolerances and standards for welding and metal finishes, enforces Safety requirements during the installation process. Public Works; 1999-2000 - 1 year

Lawrence Livermore National Lab Livermore, CA

Field Area Manager for Jacobs' $185M self performs activities with Union craft to install the Laser Beam Enclosures. Duncan enforced all Safety Regulations, Personal Protective Equipment, Clean Construction Protocol, Project Labor Agreement, and schedule activities. Duncan was the primary field contact with LLNL personnel for schedule coordination, engineering RFI's, Quality Control, managing non-conformance reports, and safety incidents. Conducted daily coordination with Superintendents, Subcontractors, and the Client to control installation activities in each area and avoid craft conflicts to maintain schedule objectives. Public Works; 2000-2003 - 3 years.

San Francisco City Hall Renovation
San Francisco, CA

SF City Hall Seismic Retrofit & TI Modification-$200M, w/GC: Managed MEPS Subcontractors through design coordination, submittal review, sequential scheduling, Quality management, installation, and start-up. Duncan worked closely with TI Architect to incorporate new systems with existing and new architectural designs. Worked hand in hand with SF DBI by pre-inspecting installations and notifying the Inspectors when systems were ready. Public Works; 1995-1999 - 4 years.

Singapore US Embassy
Livermore, CA

US Fed Government Embassy at Singapore-$50M, w/GC; Stateside coordinator controlling mechanical and electrical vendor's submittal documentation for approval for Quality management, construction installation and systems operations. Write requisitions and submittal requirements for mechanical equipment for purchase orders. Resolve conflicts between overseas site and domestic vendors. Public Works; 1993-1995 - 2 years.

Sharks Hockey Arena
San Jose, CA

San Jose Sharks Ice Hockey Arena-$150M, w/CM; Directed mechanical & plumbing subcontractors to comply with the City DPW ICBO Code requirements with project specifications involving wet and dry HVAC and plumbing including seismic bracing systems. Duncan verified all installation met Contract Specifications & Drawings and equipment start-up and systems operational modes. Assisted SJ DPW on completion of ICBO Plumbing Code required pipe testing and clearances. Duncan had an active ICBO Plumbing Certification from 1988 to 1998. Public Works: 1992-1993 - 1 year.

US Postal Service
860 Main Street
San Francisco, CA

US Postal Service Lost Package Facility and the US Treasury Department. US Post Offices added HVAC & Fire Protection to floors that were modified from open rooms to partitioned offices. US Treasury Dept. upgraded office spaces, Computer Room and Automated check envelope wrapping machine. Duncan performed all Quality Control and code inspections for Fire Protection, plumbing, mechanical and HVAC Controls installations. Public Works: 1991-1992 - 1 year.

Convention Center
San Jose, CA

The San Jose Convention Center is the main convention center for the city of San Jose, California. It is located in close proximity to several others of San Jose's convention and cultural structures. The San Jose McEnery Convention Center provides more than 425,000 square feet of space for conventions and events. Its flexible configuration offers 143,000 square feet of divisible, column-free prime exhibit space, a large ballroom, up to 30 meeting rooms with up to 2,400 theater-style seats and banquet facilities for up to 5,000 persons. In addition, the Convention Center has 30-foot-high finished ceilings, 12 loading bays with drive-on access to the exhibit hall floors, recessed utility boxes with electricity, water and drainage capabilities complete audio-visual, sound and lighting services, cellular, standard and ISDN telephony services and fiber optic and copper cabling throughout the facility with DS-3 high-speed Internet access. As the plumbing and mechanical inspector for O'Brien-Kreitzberg Inc., Duncan inspected all plumbing & mechanical installations to insure project Quality, and code compliance in conjunction with the ICBO Plumbing City Inspector. Active in resolving RFI and Code issues with plumbing Inspector. Duncan had an active ICBO Plumbing Certification from 1988 to 1998. Public Works 1987-1990 - 3 years.

CERTIFICATIONS AND PROFESSIONAL MEMBERSHIPS

US Army Corps of Engineers/NAVFAC Quality Certified, 2012
OSHA 10 & 30 Hour Certified
American Society of Mechanical Engineers; Life Member

Professional Profile for Mario B. Saladana, Webcor/Obayashi Quality Control Specialist

Current Position

Mario B. Saladana serves as a Quality Control Specialist/Senior Superintendent.

Experience

Mario has 35 years of construction experience and 28 years where with Webcor.

Mario has extensive familiarity with construction codes and practices, overseeing subcontractors and with residential, hospitality, and concrete projects.

Mario is familiar with a wide variety of project types and delivery methods.

As a Quality Control Specialist/ Senior Superintendent, Mr. Saldana assumes responsibility for on-site activities including overall coordination and scheduling of subcontractors and self-performed labor, safety, and quality. He develops and manages the schedule to ensure on-time performance. Together with the project management staff, Mr. Saldana collaborates in design, estimating and constructability reviews. He manages subcontractor performance on-site.

Professional Profile for Jose Verduzco
Webcor/Obayashi Quality Control Specialist

Current Position

Jose Verduzco serves as a Quality Control Specialist/Assistant Superintendent.

Experience

Jose has extensive familiarity with construction codes and practices.

Jose is familiar with most major construction methods.

As a Quality control Specialist/Assistant Superintendent, Mrs. Verduzco plans, schedules, coordinates, sequences, and monitors procurement and construction activities for field teams. He conducts field reviews to inspect and assure compliance to construction policies, procedures, and standards. He reviews drawings, specifications, and subcontractor submittals and ensures that field staff and subcontractors comply with required safety standards. In addition, Mrs. Verduzco prepares correspondences and reports, generates short interval schedules, and manages self-performed labor. He assumes responsibility for weekly LDR quantities and orders necessary materials and equipment.

Education

Jose holds a Bachelor of Science, Business Management in Commerce, Santa Clara University, Santa Clara, CA 2007

2.10 TRADE SUBCONTRACTORS QUALITY CONTROL MEETINGS:

In addition to the Three Phase of Control Meetings, A Trade Subcontractor QC Meeting will be part of the Weekly Trade Subcontractors Meetings held by the Webcor/Obayashi JV Project Superintendent or Project Manager. W/OJV CQC Manager will review with the Trade Subcontractor QC Manager will review current QC issues as a segment of the weekly meeting; addressing the schedule, testing, inspection, re-work log, failed inspection status, short-term schedule of QC activities, project tests, submittal status, factory verification requirements, inspection results and any other QC issues relevant to the current activities.

2.11 DEFINITIONS:

- Project As-Built Drawings – All changes and modifications to the Contract work as required by site conditions and inspections in accordance with the requirements of Section 01 17 20.
- **Contractor -** Webcor/Obayashi Joint Venture ***(WOJV)***
- **Coordination Meeting (Meeting of Mutual Understanding) -** A meeting held after the pre-construction conference for each Trade Work Package and before start of construction. Contractor shall meet with the TJPA Representative and TJPA QA Manager and discuss the Contractor's quality control system as it relates to the work of the trade package. Submit the CQC Plan a minimum of 15 days prior to the coordination meeting. During the meeting, a mutual understanding of the system details must be developed, including the forms for recording the CQC operations, control activities, testing, administration of the system for both onsite and offsite work, and the interrelationship of Contractor's management and control with the TJPA Representative's quality assurance. Minutes of the meeting will be prepared by the TJPA Representative, signed by both the Contractor and the TJPA Representative and will become a part of the Contract file. There may be occasions when subsequent conferences will be called by either party to confirm mutual understandings and/or address deficiencies in the CQC system or procedures that may require corrective action by the Contractor.
- **Corrective Action Plan -** A plan of action to correct nonconforming work or practices. A written document submitted by the Trade Subcontractor detailing the Trade Contractor's approach to correct an item of work that fails to conform to the project requirements.
- **Corrective Action Request -** A written request from TJPA to develop a Corrective Action Plan for non-conforming work (TJPA form QA-09-01) that establishes a method for ensuring deficiencies in process or implementation

adversely affecting quality are identified, cause determined, and an action plan to prevent recurrence is documented.

- **CQC Field Specialist -** specialized personnel to implement the CQC Plan be responsible to the CQC System Manager, be physically present at the construction site during work on their areas of responsibility, and have the necessary education or experience. These individuals may perform other duties but must be allowed sufficient time to perform their assigned quality control duties as described in the CQC Plan.

- **CQC Manager** – The Webcor/Obayashi JV Manager who is responsible for managing the Contractor's CQC System.

- **CQC Manager's Monthly CQC Report -** A section of the Contractors monthly written report prepared and submitted by the CQC Manager which reports monthly CQC activities.

- **CQC Plan -** Webcor/Obayashi JV written quality management plan that meets the requirements of the TJPA Program QMS The means by which Webcor/Obayashi JV (the Contractor/CQC) and its Trade Subcontractors (QC) ensure project quality.

- D**aily Contractor Quality Control Report -** A daily written report providing evidence that required quality control activities and tests have been performed including the work of Trade Subcontractors and Suppliers. These reports shall address deficient features and include a statement that equipment and materials incorporated in the work and workmanship comply with the Contract. These reports shall be within 5 working days after the date covered by the report. Reports shall be reviewed for completeness and accuracy, revised, signed and dated by the CQC System Manager. Reports shall be prepared by all subordinate quality control personnel and be included within the CQC System Manager's report.

- **Definable Feature of Work (DFOW)** - A definable feature of work is a task that is separate and distinct from other tasks, has separate control requirements, and may be identified by different trades or disciplines, or it may be work by the same trade in a different environment. Although each section of the Specifications may generally be considered as a definable feature of work, there are frequently more than one definable feature under a particular section. This list will be agreed upon during the coordination meeting and updated as more packages are awarded.

- **Federal Transit Administration (FTA) -** An administration within the U.S. Department of Transportation that provides stewardship to support a variety of locally planned, constructed, and operated public transportation systems throughout the United States.

- **Initial Phase Checklist –** A checklist prepared for each Definable Feature of Work (DFOW) in the Initial work Phase per 01 14 00 1.9.C.

- **Master Definable Feature of Work List -** The project list definable features of work for all trade subcontractors maintained by the Webcor/Obayashi JV CQC Manager.

- **Nonconformance Report –** A written report entered in BIM 360 Field Systems describing non-conforming Work.

- **Nonconforming Work** – Work that is unsatisfactory, faulty, defective, or deficient; Work that does not conform to the requirements of the Contract Documents; Work that does not meet the requirements of inspection, reference standards, tests, or approval referred to in the Contract Documents; or Work that has been damaged prior to Final Completion.

- **Phase 1: Preparatory Phase** – A controlled activity including a meeting conducted by the Webcor/Obayashi JV CQC Manager and ***with*** the Trade Subcontractors CQC Manager, the Subcontractor's Production Team, Trade Subcontractors Representatives, Inspectors, and TJPA representatives. This is the first of the three phases of control where all requirements of the work: drawings, specifications, submittals, RFI's, installation and coordination issues are reviewed before beginning any Definable Feature of Work (DFOW).

- **Phase 2: Initial** – A controlled activity including a meeting conducted by the Webcor/Obayashi JV CQC Manager with the Trade Subcontractors CQC Manager, the Subcontractor's Production Team, Trade Subcontractors Representatives, Inspectors, and TJPA representatives is held immediately prior to the start of the work. Using the meeting minutes from the Preparatory Phase meeting, this meeting transfers the information and requirements and agreements to the crews performing the work.

- **Phase 3: Follow-up Phase** Daily checks performed by the trade subcontractor QC an QC specialists and verified by QC System Manager to assure that control activities, including control testing, are providing compliance with contract requirements, until completion of that particular feature of work. Report the checks in the Daily QC report and upload to the DFOW records.

- **Preparatory Phase Checklist -** A checklist prepared by the CQC Manager for each Definable Feature of Work (DFOW) in the Preparatory Phase per 01 14 00 1.9.B.
- **Quality** - Conformance to the requirements established by the contract documents.
- **Quality Control Plan -** An approved written plan which includes plans, procedures, and organization necessary to produce an end product that complies with the Contract requirements. The plan covers all construction operations, both onsite and offsite, and shall be keyed to the proposed construction sequence
- **Quality Inspection** - An Inspection of the work performed as the work progresses or prior to calling for an Agency, Code or Special Inspection to confirm the work meets the requirements of the Contract Documents. Contractor shall verify all dimensions in the field and shall check all field conditions continuously during construction. Contractor shall inspect related and appurtenant work and report in writing to the TJPA Representative any conditions that will prevent proper completion of the Work in accordance with the requirements of the Contract.
- **Quality Management -–** Management of Quality Control and Quality Assurance activities instituted to achieve the quality levels established by the contract documents.
- **Quality Management System Manual -** Provides specific requirements for Program implementation based upon the Program Quality Policy and the FTA Quality Assurance and Quality Control Guidelines and is the guide for all members of the Program Management Team to deliver a project that meets the highest quality standards (reference: Transbay Transit Center QMSM, Introduction, page 1).
- **Submittal Log -** A written list indicating the status of all Submittals required by the Contract Documents, maintained by the Webcor/Obayashi Joint Venture production team.
- **Technical Specifications –** Divisions 01 through 33 of the project specifications.
- **Three Phases of Control** – The three meetings or actions that bring the Trade Subcontractors CQC Managers, Contractor's Production Team, Inspectors, TJPA representatives and/or field crews together to plan and implement project

quality: The three phases of control include: The Preparatory Phase, Initial Phase and Follow-up Phase.

- **TJPA Construction Management Oversight Manager: -** Turner Construction.
- **TJPA: -** Transbay Transit Center Joint Powers Authority.
- **Trade Subcontractor QC Manager** – The Trade Subcontractor employee who is responsible for managing the Trade Subcontractor's QC System, and reports to the Webcor/Obayashi JV CQC Manager.
- **Trade Subcontractor's QC Plan –** The Trade Subcontractors written quality control plan that meets the requirements of the TJPA Program QMS as appropriate for the Trade Subcontractors scope of work and is the means by which the Trade Subcontractors ensure project quality.
- **Trade Subcontractor's Definable Feature of Work List. -** The list of definable features of the work prepared by the Trade Subcontractors and submitted for review and approval to the Webcor/Obayashi JV CQC Manager
- **Trade Subcontractors Daily Quality Control Report -** The Trade Subcontractors Quality Manager's daily report that describes: the work completed, quality measures implemented, testing and inspections performed, rework items identified, and deliveries received and as-built drawings updated. (See Tab 12 "Forms" Trade Subcontractors Daily Quality Control Report).
- ***BIM 360* –** Field ***Web-Based Data*** Management Software for construction. BIM 360 Systems combines mobile technologies and BIM at the point of construction with reporting for management. BIM 360 Field Systems field management software uses a combination of technologies including the Internet, tablets, and email-capable phones. Licensed users must have a high-speed Internet connection in the office and are responsible for procuring the necessary hardware required for field staff to use the software. All Subcontractors are required to use the BIM 360 Field Systems software, as described in Specification Section 01 31 25 (The field management system will be used to manage CM/GC and Subcontractor quality control inspection and test processes including CM/GC and Subcontractor quality control inspection reports, CM/GC and subcontractor quality control inspection request, nonconforming conditions, punch list, and incomplete items list. The field management system will also be used to manage the commission process, documenting the completion of commissioning-related tests and the resolution of any identified deficiencies). Reporting features include Field Condition Reports, Inspection Requests, Nonconformance Reports and Punch lists.

3.0 ELEMENT 3 DESIGN CONTROL

3.1 INTRODUCTION

3.2 DESIGN/BUILD PACKAGES

3.3 ROLES & RESPONSIBILITIES OF THE OWNER AND THE DESIGN BUILD TRADE SUBCONTRACTOR

3.4 AS-BUILT DRAWINGS

3.5 SUBMITTAL REVIEW

3.0 DESIGN CONTROL

3.1 INTRODUCTION

Design control as implied in this Element is limited to Design-Build packages where applicable, as-build drawings and submittal review and coordination by Webcor/Obayashi is primarily accomplished by QC Management, Oversight and coordination design/build package, where specified and ensuring that the design requirements are understood, planning the design interfaces and design verification activities, executing the design verification activities, and controlling design changes through project completion.

The designer shall prepare a plan for design/built activities. It should also identify the various organizational interfaces required between various groups producing and commenting on the design, and specify the information to be documented, transmitted, and regularly reviewed.

Appropriate procedures shall be established for the identification, documentation, review, and approval of all changes and modifications to the design. This responsibility should extend to those responsible for construction or manufacturing to ensure compliance to design requirements and for development of "as-built" documents as part of the design documentation at the end of the project.

Each group responsible for design/built shall provide its own written QC procedures. These include peer review of drawings and check calculations. QA activities are performed to verify compliance to established QC procedures and to determine the effectiveness of the procedures in meeting quality program objectives.

Specification Section 01-14-00 Quality Control Paragraph 1.6 B. Procedures for scheduling, reviewing, certifying, and managing submittals, including those of Trade Subcontractors, offsite fabricators, Suppliers, and purchasing agents. These procedures must be in accordance with Section 01 13 00, Submittals.

3.2 DESIGN BUILD PACKAGES

W/OJV Shall:

- Clearly define requirements of the QA/QC Program in the contract documents.
- Coordinate with owner agency oversight activities in order to assure effectiveness of the QA/QC Program.

- Require additional levels of reporting and/or detail by the DB contractor team.
- Clearly define roles and responsibilities of parties involved early in the bid documents.
- Maintain a proactive and systematic quality program that encompasses all the project lifecycle stages.

3.3 Roles and Responsibilities of the Owner and the Design-Build Trade Subcontractor

QC program effectiveness hinges on clear allocation of roles and responsibilities to the involved parties. QA/QC roles and responsibilities shall be defined clearly in the contract documents; and more importantly, are agreed upon by the parties at the outset. It is recommended that the owner agency conduct audits and testing at every stage of the QC process, and retain ownership of the resident database. TJPA has elected to retain the Quality Assurance (QA) role with the design-build contractor performing the Quality Control (QC) activities.

3.4 As-Built Drawings

Trade Subcontractors have design-build responsibilities (such as the access trestle and traffic bridges), their quality control plans shall include design control for their scope of work.

- The Trade Subcontractors shall keep an accurately marked, up-to-date set of as-built drawings for the work actually installed, and accurately indicate on as-built drawings all site conditions, locations of utilities, work scope changes, changes in dimensions, locations, and elevations of the Work, and changes in details as specified herein and as approved by the TJPA Representative. Trade Subcontractor shall keep the as-built drawings current as the Work is performed.
- Prior to acceptance of the Work, Trade Subcontractor shall furnish to the Webcor/Obayashi JV CQC Manager the final as-built drawings, showing all changes in the Contract Drawings neatly in red ink.
- Trade Subcontractors will delegate responsibility for maintenance, coordination, and accuracy of the as-built drawings to one person on their staff.
- Accuracy of as-built drawings shall be such that future searches for items shown on the Contract Documents may rely on information obtained from the approved as-built drawings.
- Trade Subcontractors shall store as-built drawings apart from documents used for performing the work; keep in a dry, legible condition, and in good order. Label each document “AS-BUILT DRAWINGS— JOB SET” in large, neatly printed letters.
- Trade Subcontractors shall record neatly on the as-built drawings all changes made by clarifications, Change Orders, Requests for Information, and other Modifications to the Contract Documents; and changes to reflect the actual

existing conditions and utility locations references to permanent accessible features of the Work.

- Trade Subcontractors shall clearly describe changes on as-built drawings by note as required.
- Trade Subcontractors shall date all entries, calling attention to the entry by a “cloud” drawing around the area or areas affected.
- Trade Subcontractors shall record in each Specification Section the manufacturer, trade name, catalog number, and supplier of each product and equipment item incorporated into the Work.
- Trade Subcontractors shall furnish a copy of the final shop drawings which have been updated to show actual conditions. Furnish additional drawings as necessary to record deviations from the sizes, locations, and other features of the Work and to locate piping, conduit, ductwork, and similar elements of utility installations by dimensions referenced to permanent accessible features of the Work.
- Trade Subcontractors shall show on the job set of as-built drawings, by dimension accurate to within 1 inch, the centerline of each run of conduits, circuits, piping, ducts, and similar items which are shown schematically on the Contract Drawings but where the final physical arrangement is determined by Trade Subcontractor.
- Trade Subcontractors shall keep as-built drawings up to date during the entire progress of the Work, and provide access for monthly. Updates shall be accurate and current and be done at the time work is performed.
- Trade Subcontractors shall also update and include the revised or newly issued drawings as part of the as built drawings. The work of reproducing and issuing Change Order drawings and updating of as built drawings shall be done as incidental work.

3.5 SUBMITTAL REVIEW

Submittals will be reviewed for coordination, completeness, clarity and coordination with other trades prior to submitting to the TJPA. To obtain approval from the Architect/Engineer/Consultant for all materials, assemblies, equipment and shop drawing submittals required by the contract documents.

The purpose is to install materials, assemblies and equipment only after approval is obtained from the appropriate reviewing Architect/Engineer/Consultant responsible for the particular scope of work.

- Webcor/Obayashi and TJPA process submittals using two different types of project management software. Webcor/Obayashi uses internal system and TJPA uses ConstructWare.
- In WOJV System submittal packages contain submittals and all of the history of the submittal is tracked at the submittal level. The submittal package is simply the nest of the submittals that are attached to it.

- Submittals are transmitted to TJPA from Webcor/Obayashi via WOJV internal system and ConstructWare.
    - The naming format of the PDF submittal is crucial for the transmission to be successful.
- Submittal Actions Status:

ACTION	STATUS
Received	Open
Sent	Submitted
Returned	No Exceptions Taken, Make Corrections Noted, Revise and Resubmit, or Rejected
Forwarded *For the Record*	Same as Returned Status *Submit for record only*

4.0 ELEMENT 4 ***DOCUMENT CONTROL***

4.0 DOCUMENT CONTROL

4.1 INTRODUCTION

Webcor/Obayashi's Document Control process is the means by which information Specified in the Contract Documents to be in Webcor/Obayashi's and the Trade Subcontractors' control are logged, filed, and updated to assure that the organization's staff is using the most current approved documents and they are following the most recently approved procedures and standards and that are compliance with contract and applicable FTA, 15 Element Guidelines.

Procedures for control of project documents and data have been established and shall be maintained. The document control measures should ensure that all relevant documents are current and available to all users who require them.

Control of project documents includes the review of documents by authorized personnel, the distribution and storage of these documents, the elimination of obsolete documents, and control of changes to the documents. Copies of the documents shall be distributed so that they will be available at all locations that need them for effective functioning of the quality management system. Obsolete documents will be promptly eliminated from each work location. Any superseded documents retained for the record will be clearly identified as such. The same authorized personnel who reviewed and approved the original documents, unless the control procedures specifically allow otherwise, should review changes to the documents and data. Changes will be promptly distributed to all locations, along with a master list enumerating the current revisions of each document.

Following are examples of the types of documents requiring control:

- Drawings
- Specifications
- Inspection procedures
- Test procedures
- Special work instructions
- Operational procedures
- QA program and procedures

4.2 SUBMITTAL MANAGEMENT

The Submittal process is designed to assure that all material, assemblies, equipment and shop drawings meet the Transbay Transit Center project requirements and are approved by the TJPA prior to procurement and installation. The Submittal process is the means by which the Trade Subcontractors control product purchasing. This submittal schedule will be developed incrementally and additional submittals will be added as trade packages are awarded and subcontractors are brought on board. Trade Subcontractors will submit their submittal schedules compliance with contract and FTA element guidelines for approval, as required in the Division 00, 01 and technical specifications, prior to the start of work. Element 4 guidelines state that control of project documents includes the review of documents authorized personnel, the distribution and storage of these documents, the elimination of obsolete documents and control of changes to the documents.

4.3 SUBMITTAL MANAGEMENT AND DOCUMENT CONTROL PROCEDURES

The Webcor/Obayashi JV Document Control and Submittal management procedures are part of Webcor/Obayashi's Transbay Transit Center Policy and Procedures Guide. The relevant sections of that guide addressing submittal management and document control are listed below and are included in this section of the Webcor/Obayashi JV CQC Manual:

4.3.1 Document Control

4.3.2 Submittals

4.3.3 Transmittals

4.3.4 Document Distribution matrix

4.3.5 Master project document log

4.3.6 CQC file structure

4.3.1 DOCUMENT CONTROL

The purpose of this outline is to provide guidelines for establishing the appropriate D document control system for the management of the Transbay Transit Center project. This will include the review of documents by authorized personnel.All Controlled documents will go through Document Control to be logged and tracked.

WO0000-011400WO1.10

What is a controlled document? A controlled document is defined for this project as any contract document or correspondence which includes i) contract requirements, or ii) scope definition or requirements, including distribution of all Contract Documents (e.g. addendum, ***ASI's*** bulletins, work orders, etc.) either to/from TJPA or Trade Subcontractor. Controlled documents received will be date stamped, logged, saved electronically (in some cases hard copies filed), distributed internally, monitoring response/process time (also referred to as work flow), distribute externally, and track the distribution list.

The following is a list of **controlled document** examples:

- Project Document Distribution – Internal/External
    - Design Documents
    - Construction Document
    - ASI's
    - Sketches- to be issued with ASI's or RFI's and not on their own.
    - Reference Documents
- Submittals, including all LEED submittal requirements and substitutions.
- Design Review Questions (DRQs) - Preconstruction
- Request for Information (RFIs) - Construction
- Daily Reports and Daily Quality Control Reports
- Safety Memos – Logged and tracked
- Schedules and schedule reports
- Permit Inspections
- Payment Applications
- Cash Flow Projections
- Monthly Progress Reports
- Permits
- Original Documents - Custodianship of all original documents in a Master File until they can be boxed and transferred for long term storage.
- Formal Correspondence; including all formal incoming/outgoing correspondence
- Contract Notification Correspondence; delay notification, etc.
- Contract Modifications
- Virtual Building/Models
- Meeting Minutes
- Transmittals
- Requests for Qualification (RFQ)
- Invitation for Bid (IFB)
- Subcontracts & Change Orders
- Long Form/Short Form Purchase Orders (PO)
- SBE/DBE
- Closeout documents

- Reimbursements

Uncontrolled Documents: The following are some examples of uncontrolled documents:

- Email correspondence
- Field Tags – Collected and tracked by Cost Control
- Purchase Order – Managed by Procurement/Cost Control

4.3.2 SUBMITTALS

Submittals will be reviewed for coordination, completeness, clarity and coordination with other trades prior to submitting to the TJPA. To obtain approval from the Architect/Engineer/Consultant for all materials, assemblies, equipment and shop drawing submittals required by the contract documents.

The purpose is to install materials, assemblies and equipment only after approval is obtained from the appropriate reviewing Architect/Engineer/Consultant responsible for the particular scope of work.

- Webcor/Obayashi and TJPA process submittals using two different types of project management software. Webcor/Obayashi uses internal and TJPA uses ConstructWare.
- In WOJV System submittal packages contain submittals and all of the history of the submittal is tracked at the submittal level. The submittal package is simply the nest of the submittals that are attached to it.
- Submittals are transmitted to TJPA from Webcor/Obayashi via WOJV internal system and ConstructWare.
    - The naming format of the PDF submittal is crucial for the transmission to be successful.
- Submittal Actions Status:

ACTION	STATUS
Received	Open
Sent	Submitted
Returned	No Exceptions Taken, Make Corrections Noted, Revise and Resubmit, or Rejected
Forwarded *For the Record*	Same as Returned Status *Submit for record only*

Receive Submittal from Subcontractor – 0-5 days
Was it received on time? If not, have the Trade Scope PM notify the subcontractor that it was late. Is the submittal complete? If not, return the submittal to the subcontractor, transmittal shall include notification that the submittal is incomplete, give a date that the re-submittal is required, and notify them of their potential risk in missing the submittal date.

Review the submittal using the submittal process checklist once the submittal is deemed complete, stamp, (All pages of shop drawings; front page only for product data), distribute to PM, QC and Supt. to review for conformance, completeness, compliance, clarity and transmit to TJPA.

Design Team Review – 12 days Design team will review the submittal. Each layer of review (Architect and Consultants) will stamp ALL pages and return to Webcor/Obayashi's document control manger.

Returned Submittal - 5 days
Reviewed by Document Manager – Notify Author. Document Control will receive e-mail notification that the submittal has been reviewed in ConstructWare. Document Control will forward the e-mail notification along will all attachments to Author.

PM Triage – Notification Sent to Subcontractors

- Revise & Re-submit or Rejected
    - Return R&R or Rejected submittal to author subcontractor. PM will include in the transmittal a due date for re-submittal (5 days). Director will make a case-by-case determination on whether to send a preliminary submittal to other subcontractors for coordination.

- No Exceptions Taken & Make Corrections Noted
    - Email author subcontractor and all affected trade subcontractors the approved submittal. PM will include transmittal with the action required.

Is there a Cost / Schedule Impact or Scope Change?
Subcontractors have 5 days from the returned date to respond with a cost or schedule impact.

Written Notification to Owner, draft RFI to Capture Cost.
Shop drawings, product data, and samples "are not contract documents" per our contract language. Therefore, any change in scope change during submittal review by design team must be captured via ASI. Director should also send written notification to ownership of any scope change incurred from a returned Submittal.

Storing Approved Submittals
Author of submittal will file all documents and correspondence within the storage folder and post the documents electronically.

- Put approved electronic copy of submittal in the designated folder

SUBMITTAL PROCESS CHECKLIST

Submittal Package No.:_____ Date Received:_____

Submittal Name:_____

- ☐ Review each submittal to:
  - ☐ Verify that the submittal's contents match the accompanying transmittal. Did we receive everything listed on the transmittal?
  - ☐ Verify that the submittal's contents are complete per the submittal register. Important: submittal packages need to be complete and should include all information necessary for review. Partial submittals are to be rejected by W/O (if we don't the TJPA will).
  - ☐ Verify that the contents of the submittal are in conformance with the technical specifications and other appropriate contract documents.
  - ○ Is the Submittal a Substitution?
    - ◉ No- Continue Processing Submittal
    - ○ Yes -Reject submittals that are substitution requests- There is a separate process for substitutions.
  - ☐ Verify that the trade subcontractor has checked and coordinated all dimensions, materials, field measurements, with the requirements of the Work and the Contract Documents.
  - ☐ Verify that the submittal complies with the requirements of reference specifications –SFDPW, PG&E etc.
  - ☐ Confirm that all professional certifications (stamp) w/license number and expiration date are provided and signed if required.
  - ☐ Note any variations from the Contract requirements (if there are create an issue in CMiC)
  - No questions Address all questions raised or noted in the submittals; requests to verify dimensions, etc. If there are questions with the submittal:
    - Can the questions be answered by W/O?
    - Does an RFI need to be submitted?
    - Does an issue need to be created in CMiC?
    - Identify who is responsible for answering the question
  - ☐ Identify all affected and adjacent trades that can be potentially impacted by submittal. Develop an action plan to coordinate submittal information with ALL affected and adjacent trades.
  - ○ If the submittal is complete, stamp the first page of each item. If it is shop drawings, all sheets must be stamped.

Trade Scope Superintendent:_____ Date:_____

Trade Scope PM:_____ Date_____

CQC Manager:_____ Date:_____

Safety Manager:_____ Date:_____

WO0000-011400WO1.10

4.3.3 TRANSMITTALS

To ensure controlled contract documents leaving this office have a record.

Use and receipt of Transmittals is governed by the information herein.
All controlled contract document exchange with Ownership, Design Team, Subcontractor community and Agencies with Jurisdiction/Authority on the project requires a transmittal. All transmittals are created in CMiC with the reference documents listed and uploaded as attachments in CMiC. All transmittals with incoming documents are date stamped, scanned and uploaded with the documents to the pertinent folder and CMiC.

Below is a listing of all contract documents that require a transmittal to capture the exchange/submission:

- Billing
- Submittals
- Design Review reports
- Schedules & Reports
- Cost Estimates
- Drawings
- Close-out documents
- Attic Stock

Transmittal tracking numbers are auto populated in CMiC.

Subject (RE): The subject should be the same description used on other documents (ex. PCI's, Letters, e-mail, etc.) Subject should be descriptive and should include appropriate sub-job, TG Package # and description.

Remarks: ***In the section,*** the first sentence should read

RE: Transbay Transit Center [Preconstruction/TCB/Utilities/Bus Ramps select one] – 30100.[##}

4.3.4 DISTRIBUTION MATRIX

To establish guidelines for who receives what documents and in what form.

All documents received by Document Control will be distributed according to the matrices.

Distribution Matrices have been established for:

1. Internal Distribution
2. External Distribution

Internal Distribution Matrix

4.3.5 MASTER PROJECT DOCUMENT LOG AND LIBRARY EXHIBIT

To track and document all drawings and specifications issued throughout the life of the project and where these documents live.

The master project document log will be updated by Document Control as new drawings and specifications are issued.

1. Review master drawing log against drawing log issued with new drawings.
2. Update master drawing log when new documents are received with date, revision number and location of where documents are saved.

NOTE – Master Drawing Log has not been established; PMPC to issue master log.

4.3.6 CQC FILE STRUCTURE

The CQC File Structure is outlined below and will be utilized on this project to store, organize and manage Webcor/Obayashi's CQC Plan, Daily CQC Reports and DFOWs. ***This File Structure will mirror that of Constructware***.

Webcor/Obayashi will organize and store CQC documents such as the CQC Plan, Daily CQC Reports and DFOWs on the F:\ drive in a shared folder***. All required quality records*** will be uploaded into Constructware as the system of record.

CQC documents on the F:\ drive may be found at the following location.
F:\Transbay\WEBCOR\Quality Control
CQC Plans
- CQC Plan Webcor-Obayashi JV:

Daily CQC Reports
- Transbay
    - WEBCOR
        - Quality Control
            - Daily CQC Reports
                - Year
                    - Month
                        - Day
                            - Year/Month/Day – Contractor

  - Initial Phase
  - Follow up
  - DFOW Record Documents

CQC Daily Reports in Constructware may be found at the following location.

Constructware CQC Daily Reports
140 - Transit Center Building
- File Director
  - 10 Quality
    - 12 CQC Reports
      - Year
        - Month
          - Day
            - Month/Day/Year – contractor

CQC DFOW Reports in Constructware may be found at the following location.

Constructware CQC DFOW
140 - Transit Center Building
- File Director
  - 10 Quality
    - Definable Features of Work (DFOW)
      - Contractor's DFOW (Ex. BSE-TG03 – BBI)
        - DFOW Log
        - DFOW (By Number and Title)
          - Preparatory Phase
          - Initial Phase
          - Follow up Phase
          - DFOW Record Documents

DFOW – Any Reference to a DFOW requires filing a copy of each Sub's QC ***checklists*** to retrieve follow up documents in F/drive and Constructware.

5.0 ELEMENT 5 ***PURCHASING***

5.1 INTRODUCTION

5.2 CONTROL OF PURCHASED MATERIALS, PARTS AND COMPONENTS

5.0 PURCHASING

5.1 INTRODUCTION

The contract requirements will clearly specify the expectations of WOJV, including relevant standards, drawings, specifications, process requirements, inspection instructions, and approval criteria for materials, processes, and product. The purchasing documents will be reviewed and approved by WOJV and TJPA for adequacy of specified requirements prior to release. WOJV will ensure that the supplier fully understands the contract, agrees with the contract, and has the capacity to perform the work as required.

Where construction or equipment procurement is involved, the contract between WOJV and the supplier will specify the right of WOJV or TJPA authorized representatives to carry out as required inspection and testing at the source and upon receipt to verify that the work or product meets specifications.

Where equipment procurement is involved, WOJV will define, as appropriate, the means and methods for handling, storage, packaging, and delivery of product and as required per contract documents. WOJV will establish procedures to receive, inspect, store, and maintain equipment procured. Any equipment that is damaged or is otherwise unsuited for use will be documented and reported to the supplier or Trade Subcontractor.

Purchasing requirements apply to all subcontractors and suppliers, including construction contractors, and manufacturers. The purpose of this element is to ensure that purchasing requirements are clear and complete, that the supplier or trade subcontractor understands them, and that appropriate quality elements are made part of the contract. Additional requirements, such as on-site required inspection and handling and receiving procedures, may be required for construction or equipment procurement contracts.

Specification Section 01-16-00 Material and equipment referenced in this section.

Immediately upon delivery, Contractor shall inspect shipments to assure compliance with the Contract Documents and reviewed submittals, and to verify that products are undamaged and properly protected from potential damage. Undamaged products shall be delivered to the job site in manufacturers' sealed containers or wrappings with legends and labels intact. Contractor shall maintain packaged materials with seals unbroken and labels intact until time of use. "

5.2 CONTROL OF PURCHASED MATERIALS, PARTS AND COMPONENTS

- As part of bid package development Webcor/Obayashi JV will prepare trade package specific subcontractor prequalification requirements. These prequalification's are submitted to, and reviewed by the TJPA.

The pre-qualification requirements are then included in the project bidding manual.

- Prior to contract award Webcor/Obayashi JV verifies that all trade subcontractors and suppliers meet the project requirements as outlined in the project bidding manual and contract documents.
- Schedule work to be tested or inspected to allow test to be performed within reasonable time.

6.0 ELEMENT 6 ***PRODUCT IDENTIFICATION & TRACEABILITY OF MATERIAL, PARTS & COMPONENTS***

6.1 OVERVIEW

6.2 MATERIAL IDENTIFICATION

6.3 PRODUCT IDENTIFICATION AND TRACEABILITY

6.0 PRODUCT IDENTIFICATION AND TRACEBILITY

6.1 OVERVIEW

W/OJV and Trade Subcontractors will identify and document material and products delivered to the site using the material checklist. Material and products will be reviewed for deficiencies. Once a deficiency is identified by using the material checklist, there is a systematic method to control the item, correct it, and ensure that project quality is not adversely impacted.

When the material or product is identified as deficient it will immediately be segregated. Segregation may occur by physical isolation and cordoning off of work/materials, or conspicuously identified by tags/markings when physical isolation is not possible. BIM 360 will be used to identify deficient materials on equipment and track resolution and closure.

6.2 MATERIAL IDENTIFICATION

Measures shall be established and maintained for identifying and controlling items of production (batch, materials, parts, and components) to prevent the use of incorrect or defective items and to ensure that only correct and acceptable items are used or installed.

Physical identification and control shall be used to the extent possible. Where physical identification is impractical, physical separation, procedural control, or other appropriate means may be employed. Items that fail to possess identification, or items for which record traceability has been lost, or items that do not conform to requirements shall be segregated to prevent use or installation. An item shall be able to be identified by how it is marked or where it is located.

Specification Section 01-16-00 Material and equipment; 1.6 D & E
Immediately upon delivery, Contractor shall inspect shipments to assure compliance with the Contract Documents and reviewed submittals, and to verify that products are undamaged and properly protected from potential damage.

1. Undamaged products shall be delivered to the job site in manufacturers' sealed containers or wrappings with legends and labels intact. Contractor shall maintain packaged materials with seals unbroken and labels intact until time of use.

2. Contractor shall promptly remove damaged material and unsuitable items from the job site, and promptly replace with material meeting the specified requirements at no increase in Contract Sum without impact to construction schedule.

3. Unsuitable materials and products not removed promptly from the job site by Contractor may be removed by the TJPA. Removal costs shall be paid by Contractor.

4. Contractor shall identify materials and equipment delivered to the Site to permit checking against submittals and shop drawings.

The TJPA may reject as non-complying such material and products that do not bear identification satisfactory to the TJPA as to manufacturer, grade, quality, and other pertinent information.

6.3 PRODUCT IDENTIFICATION & TRACEABILITY

Product identification and traceability shall take place during all the various production phases – from receipt of raw materials, components, or subassemblies through the manufacturing process, to delivery of final products or systems. Traceability shall mean traceable to Transbay Terminal Center project, specific warranty, test report, supplier, point in time, purchase order, or through production. Raw materials shall be traceable back to a particular batch number, shipment number, packing slip, or invoice and shall be accompanied by applicable test data sheets and material certifications. Store room or inventory tracking procedures shall allow for items to be traceable back to a particular order number, batch number, date received, test lot, or other pertinent source. Assemblies in production shall be traceable to Transbay Terminal Project through the use of some form of routing documentation. Routing documentation should contain sufficient manufacturing information, including work instructions, manufacturing standards, tooling, etc. Final assemblies should be clearly marked with project numbers, model numbers, serial numbers, bar codes, etc., so that all pertinent information regarding that assembly may be retrieved.

7.0 ELEMENT 7 ***PROCESS CONTROL***

7.0 PROCESS CONTROL

The contractor quality control process is the means by which W/OJV, Trade Subcontractors and Suppliers shall identify and plan the production and installation processes.

Suppliers and Trade Subcontractors process control shall identify and plan the production and installation processes that directly affect quality and shall ensure these processes are performed under controlled conditions. Special processes, the results of which cannot be verified by subsequent inspection and testing of the product, shall be continuously monitored. To achieve accuracy and consistency in production and installation processes, the quality program shall provide for:

- Documented work instructions where such are needed to ensure quality, use of suitable production and installation equipment, a suitable working environment, personnel qualifications, and conformance with referenced standards/codes and Quality Plans

- Monitoring and controlling of processes and product characteristics during production and installation.

Continuous monitoring and/or conformance with documented procedures is required during special processes, such as welding, nondestructive testing, and heat treatment, where the results will impact quality of the final product, but where inspection after the fact will not reveal the deficiencies.

Ensure that work is performed in the proper sequence. For example, welds should be inspected before they are painted. Earth should be compacted before concrete is poured. Documented work instructions can help with sequence control where there is complex work or when there are multi-disciplined interfaces.

Procedures or guidance to be in conformance with contract and FTA Guidelines for Control of special processes by the Trade Contractors.

Sequence of work must be identified by subcontractor prior to final fabrication on installation. Documented work inspections are required per DFOW Preparatory meeting and will be the basis for process control.

8.0 ELEMENT 8 INSPECTION AND TESTING

8.0 INSPECTION AND TESTING

8.1 QUALITY INSPECTIONS

The Webcor/Obayashi JV Quality Control Manager or CQC Manager's alternate will verify that Trade Subcontractors are meeting the requirements outlined in the TJPA Quality Management System Manual, sections 8.5.1 Inspection and Test Planning and 8.5.2 Contractor Inspection Requirements, to provide documented evidence of inspections, lab reports and test results as required per contract. The Trade Subcontractors will also perform required inspections of all purchased items, perform source inspections, perform first article inspections and perform end process inspections and testing. Webcor &Trade Subcontractors personnel will receive training on methods to physically inspect and document critical structural DFOW components prior to ISI inspection as TJPA's 3rd Party Inspector.

Inspection and Testing- Inspection and testing procedures should be planned and executed as necessary to verify quality. Procedures should be specified, implemented, and the results documented for receiving incoming products, and for final inspection and testing.

When products are delivered to W/OJV, it is the responsibility of W/OJV and trade subcontractor QC Manager to verify they are in conformance with requirements. Verification should be in accordance with the Quality Plan or documented procedures. The extent of receiving inspection can vary with the amount of inspection at the source, the safety criticality of the product, and the confidence in the quality procedures of the supplier.

In process testing and inspection of the work to verify conformance of an item or work activity to specified requirements, should be in a conformance with the Quality Plan on documented procedure process and balance to quality. Both inspection and process monitoring methods shall be performed, as necessary, to ensure that the specified requirements for the control of work processes and the quality of the item are being achieved throughout the duration of the work.

Final inspection and testing should ensure that all specified inspections and tests, including those specified for receipt of product or in-process work, have been carried out and the resulting data meet specifications. Final inspection and testing should be carried out and properly documented to ensure conformance of the finished product to the specifications.

Records should be maintained of the various inspections and tests to provide evidence that the product has passed inspection and/or test with defined acceptance criteria.

8.2 INSPECTION AND TESTING LABORATORY SERVICES (SPEC. SECTION 01 14 00)

Where specified, the TJPA Representative will appoint, employ, and pay for services of an independent firm to perform inspections, testing, and other services specified in individual specification sections and as required by the TJPA Representative.

Where specified, trade subcontractors will appoint, employ, and pay for services of an independent firm to perform inspections, testing, and other services specified in individual specification sections.

Control, verification, and acceptance testing procedures for each specific test to include the test name, specification paragraph requiring test, feature of work to be tested, test frequency, and person responsible for each test. (Laboratory facilities approved by the TJPA Representative must be used.)

8.3 COORDINATION MEETING (SPEC. SECTION 01 14 00 - 1.7)

After the pre-construction conference for each Trade Work Package, before start of construction, Contractor and Trade subcontractor shall meet with the TJPA Representative and TJPA QA Manager and discuss the Contractor's quality control system as it relates to the work of the trade package. Submit the CQC Plan a minimum of 15 days prior to the coordination meeting. During the meeting, a mutual understanding of the system details must be developed, including the forms for recording the CQC operations, control activities, testing, administration of the system for both onsite and offsite work, and the interrelationship of Contractor's management and control with the TJPA Representative's quality assurance. Minutes of the meeting will be prepared by the TJPA Representative, signed by both the Contractor and the TJPA Representative and will become a part of the Contract file. There may be occasions when subsequent conferences will be called by either party to confirm mutual understandings and/or address deficiencies in the CQC system or procedures that may require corrective action by the Contractor.

8.4 TESTS (SPEC. SECTION 01 14 00 1.10)

Trade subontractor shall perform specified or required tests to verify that control measures are adequate to provide a product that conforms to Contract requirements. Upon request, Contractor shall furnish to the TJPA duplicate samples of test specimens for possible testing by the TJPA. Testing includes operation and/or acceptance tests when specified. Procure the services of a certified testing laboratory. Perform the following activities and record and provide the following data.

- Verify that testing procedures comply with contract requirements.

- Verify that facilities and testing equipment are available and comply with testing standards.
- Check test instrument calibration data against certified standards.
- Verify that recording forms and test identification control number system, including all of the test documentation requirements, have been prepared.
- Record results of all tests taken, both passing and failing on the CQC report for the date taken. Specify paragraph reference, location where tests were taken, and the sequential control number identifying the test. If approved by the TJPA Representative, actual test reports may be submitted later with a reference to the test number and date taken. Provide an information copy of tests performed by an offsite or commercial test facility directly to the TJPA Representative. Failure to submit timely test reports as stated may result in nonpayment for related work performed and disapproval of the test facility for this Contract.

1.2. B Trade Subcontractor's QC service responsibilities:

- "Cooperate with testing agency personnel.
- Provide access to the Work.
- Obtain and handle samples of materials and equipment as defined in Section 01 13 00, Submittals.
- Furnish storage and assistance as requested.
- Facilitate inspections and tests.
- Notify the TJPA Representative in writing a minimum of 48 hours, excluding weekends and holidays, but not more than 72 hours prior to expected time for operations requiring as needed testing or inspection services.
- Schedule work to be tested or inspected to allow tests to be performed within reasonable time period.
- Where required, deliver samples to testing agency.
- When a specified test or inspection is not performed due to Contractor's failure to notify the TJPA Representative as specified or when material, or workmanship is not ready at the time specified, the TJPA Representative will establish remedial work, and Contractor shall bear the cost of remedy.
- Take steps necessary to ensure no portion of the work requiring testing or inspection is covered prior to acceptance by authorized parties.

- Ensure that no testing or inspection is scheduled until all approvals for the work have been received. This includes welder's certifications, submittals, design/build engineering stamp, and certification".

1.3. A

"Contractor shall verify all dimensions in the field and shall check all field conditions continuously during construction. Contractor shall inspect related and appurtenant work and report in writing to the TJPA Representative any conditions that will prevent proper completion of the Work in accordance with the requirements of the Contract, Trade Subcontractor's QC service responsibilities."

1.3. B

"Contractor shall be responsible for any Work that is non-conforming. Any required removal, repair, or replacement caused by non-conforming work shall be done by Contractor at no cost to the TJPA. Such nonconforming work will be considered as defective and payments will be withheld in accordance with Section 00 07 00, General Conditions, paragraphs 9.05 and 9.08."

1.3. C

"Contractor shall be responsible for recording all changes and modifications to the Contract work as required by site conditions and inspections in accordance with the requirements of Section 01 17 20, Project As-Built Drawings."

8.5 INDEPENDENT TESTING FIRM REPORTING REQUIREMENTS

1.5. A

"Where specified, the TJPA Representative will appoint, employ, and pay for services of an independent firm to perform inspections, testing, and other services specified in individual specification sections and as required by the TJPA Representative, or the TJPA Representative will perform the inspection and testing services."

"Inspection reports will be submitted promptly by the independent firm in triplicate and distributed, one copy each, to the TJPA Representative, Webcor/Obayashi JV QC Manager, and the code authority having jurisdiction over the Project and will indicate observations and results of tests and compliance or noncompliance with the requirements as defined in the technical specifications."

8.6 TJPA CODE AND AGENCY TESTING AND INSPECTIONS

Work shall be subject to testing and inspection by representatives of the TJPA and other agencies having jurisdiction (Code and Agency Inspections) to assure compliance with all requirements of Section 00 07 00, General Conditions, and Paragraph 8.02 and as per code requirements.

8.7 TJPA Special Inspection and Testing

Where specified, the TJPA Representative will appoint, employ, and pay for services of independent firms to perform inspections, testing, and other services specified in individual specification sections and as required by the TJPA Representative or the TJPA Quality Assurance Representative will perform the inspection and testing services.

8.8 Inspection Request procedure

- The Trade Subcontractors CQC Manager will verify that all prerequisites as defined by the contract specifications are completed prior to Code, Agency or Special Inspections. Inspection Request will be submitted to the Webcor/Obayashi JV CQC Manager or CQC Alternate and the TJPA Construction Management Oversight Manager 48 hours and not more than 72 hours prior to the inspection date. Inspection Requests for Code, Agency and Special Inspections require an “Inspection Request Form” to be completed in BIM 360 Systems by Webcor/Obayashi JV or the Trade Subcontractors CQC Manager. The Trade Subcontractor’s CQC Manager will facilitate onsite inspections, sampling procedures, test reports, and provide notification to the Webcor/Obayashi JV CQC Manager and TJPA representative when inspections fail or test results fall below specified values. Notify Turner if 48 hour notice cannot be met. Inspections will be submitted 48 hours (by 3:00pm) prior to the inspection date.
    - Day 1 3:00pm is cut off time for any inspection on Day 3
    - Thursday 3:00pm is cut off time for any inspection on the weekend or following Monday:
    - Friday 3:00pm is cut off time for any inspection on the following Tuesday or later.

8.9 Test and inspection procedures by Trade Subcontractors

When specified, the Trade Subcontractors shall include as part of their scope all tests to verify that the Work conforms to the Contract Documents and to the Quality Control specification section 01 14 00 Rev 0 paragraph 1.10A Tests. Contractor shall perform specified or required tests to verify that control measures are adequate to provide a product that conforms to Contract requirements. Upon request, Contractor shall furnish to the TJPA Representative duplicate samples of

test specimens for possible testing by the TJPA. Testing includes operation and/or acceptance tests when specified. Procure the services of a certified testing laboratory. Perform the following activities and record and provide the following data:

1. Verify that testing procedures comply with the contract documents-Per Code and Contract Requirements.
2. Verify that all inspection prerequisites are met prior to conducting inspections.
3. Submit a testing and inspection matrix with the design submittals showing all required inspections and the entity responsible for performing the tests or inspections, *per DFOW requirements*.
4. Track inspection and test status.
5. Verify that the facilities and testing equipment are available and comply with the testing standards. As per approved submittals.
6. Trade Contractors and Suppliers shall have documented procedures to ensure test equipment is in calibration and keep updated lists of all equipment requiring calibration. Trade Contractor shall make calibration records available for review.
7. Record results of tests taken, both passing and failing on the trade subcontractor's daily CQC report for the date taken. Specify paragraph reference, location where tests were taken. Maintain a current test results spreadsheet per each different component.
8. When the services of an independent firm are utilized, reports will be submitted promptly by the independent firm in triplicate and distributed, one copy each, for the TJPA Representative, Webcor/Obayashi JV, and the code authority having jurisdiction over the Project and will indicate observations and results of tests and compliance or noncompliance with the Contract.
9. When specified, the Trade Subcontractors shall produce test and inspection plans in accordance with the Program Quality Management System requirements. All testing and measurements specified to be performed by the Trade Subcontractors shall be performed with equipment whose calibration
10. Meets national standards and to documented standards when no national standard exists.
11. Maintain and submit a log indicating the status of the Trade Subcontractors inspections and tests.
12. Verify that facilities and testing equipment are available and comply with testing standards.
13. Check test instrument calibration data against certified standards.

14. Verify that recording forms and the test identification control number system, including all of the test documentation requirements, have been prepared. Upload test records to BIM 360.
15. Record results of all tests taken, both passing and failing, on the CQC report for the date taken. Specify paragraph reference, location where tests were taken, and the sequential control number identifying the test. If approved by the TJPA Representative, actual test reports may be submitted later with a reference to the test number and date taken. Provide directly to the TJPA Representative an information copy of tests performed by an offsite or commercial test facility. Failure to submit timely test reports as stated may result in nonpayment for related work performed and disapproval of the test facility for this Contract.
16. WOJV and Subcontractors must confirm activates are ready for inspection prior to ISI start.
17. Verify to the Webcor/Obayashi JV CQC Manager of Trade Subcontractors task completion prior to the work being inspected.
18. Verify to the Webcor/Obayashi JV CQC Manager of Trade Subcontractors task completion prior to requesting final inspections.
19. Facilitate inspections and tests.
20. Cooperate with testing agency personnel.
21. Provide access to the Work.
22. Obtain and handle samples and equipment as defined in section 01 13 00 Submittals. Furnish storage and assistance as requested.
23. Trade Subcontractor shall include within their quality control plan per Specification Section 01 16 00 Material and Equipment, article 1.3 Quality Assurance, procedures for full protection of Work and materials.
24. Where required, deliver samples to testing agency.
25. Take steps to ensure no portion of the work requiring testing or inspection is covered prior to the acceptance by authorized parties.
26. Ensure that no testing or inspection is scheduled until all approvals for the work have been received. This includes welder's certifications, submittals, design/build engineering stamp and certification.
27. Notify the TJPA Representative in writing a minimum of 48 hours. Excluding weekends and holidays, but not more than 72 hours prior to expect time for operations requiring as needed testing and inspections.
28. DFOW task checklist will be implemented to assist with inspections and comply with the required codes and contract requirements.
    A. The frequency of checklist reviews and style of checklist will vary for each DFOW task. The DFOW initial phase process will identify which entity (TJPA, W/O, Subcontractor) is performing what type of checklist review, the

frequency for check list reviews during the initial installation and follow up phases, and the style of checklist reviews.. The base understanding is that, each entity shall maintain records.

i. Subcontractor's:
    1. Procedural Review Checklist.
        a. Confirm that submittals are approved before starting work, confirm that inspections have been scheduled, confirm that inspections as-builds are being maintained, confirm that protection of material is in place.
    2. Material Controls Checklist,
        a. Each sub, for each key sequence, need to identify how they maintain records such that a deficiency in the field can be tracked back to the delivery/fabrication process. A material control checklist is the sub's QC representative review and confirmation that those procedures are being followed.
    3. Completed Installation Technical Verification Checklist,
        a. This is the detailed list of installation requirements that the sub confirms prior to calling for an inspection.

ii. W/O QC:
    1. Procedural Review Checklist
        a. Has the sub completed their technical check list, are they protecting their materials, have they complete a material controls checklist, etc.
    2. Select Installation Technical Verification Checklist
        a. Selected items within a particular W/OJV DFOW task checklist are checked by W/OJV and used to spot check/confirm that the sub's detailed checklist is accurate. Why will these vary? Because with some scopes, i.e. Welding we don't have the accreditation to make any technical evaluations – it will be a procedural review for us. On the other hand, Rebar – it's Quantity, spacing, type of bar – things that can be visually confirmed and therefore we will do some technical reviews.

iii. TJPA:

1. Procedural Review Checklist

8.10 CONTROL VERIFICATION AND ACCEPTANCE TESTING PROCEDURES

When specified, The Trade Subcontractors CQC Managers will provide control, verification, and acceptance testing procedures for each specific test to include the test name, specification paragraph requiring test, feature of work to be tested, test frequency, and person responsible for each test. (Laboratory facilities approved by the TJPA Representative must be used.).

When specified, specific control verification and acceptance testing procedures will be provided by the Trade Subcontractors as part of the Trade Subcontractors CQC plans, and will be completed as the specification sections are defined and the Trade Subcontractors are added to the project

8.11 PUNCH-OUT INSPECTION

An inspection of the Work will be conducted by the Trade Subcontractor QC Manager and verified by the Webcor/Obayashi JV CQC Manager, near the end of Trade Subcontractor's work. The punch list, entered into BIM 360 Systems, will include items that do not conform to the approved Drawings and Specifications and the estimated date by which the deficiencies will be corrected. A second inspection by the Trade Subcontractor CQC Manager will ascertain that all deficiencies have been corrected. Once this is accomplished the TJPA Representative will be notified that the facility is ready for the TJPA pre-final inspection.

8.12 PRE-FINAL INSPECTION

The TJPA Representative will perform the pre-final inspection to verify that the facility is complete and ready to be occupied. A TJPA Representative pre-final punch list may be developed as a result of this inspection. Webcor/Obayashi JV will ensure that all items on this list have been corrected before notifying the TJPA Representative, so that a final inspection can be scheduled. Items noted on the pre-final inspection will be corrected in a timely manner. These inspections and any deficiency corrections required by this paragraph must be accomplished within the time slated for completion of the entire work or any particular increment of the Work if the Project is divided into increments by separate completion dates.

8.13 FINAL ACCEPTANCE INSPECTION

The CQC System Manager, plus the Contractor's authorized representative and the TJPA Representative must be in attendance at the final acceptance inspection. Additional personnel from affected third parties may also be in attendance. The final acceptance inspection will be formally scheduled by the TJPA Representative based upon results of the pre-final inspection. The TJPA Representative will be notified at least 72 hours prior to the final acceptance inspection and include the Contractor's assurance that all punch list and nonconforming work will be complete and acceptable by the date scheduled for the final acceptance inspection.

PS-56	Are the masonry nails less than 3/4" in diameter	No		0
PS-57	Are the washers at the masonry nails less than 3/4"	No		0
PS-58	Are 3/4 washers missing from the nails	No		0
PS-59	Are the fasteners spaced greater than 12"	No		0
Waterstop - ADCOR ES (Pipe Penetrations)				
PS-60	Was/Is the substrate wet at time of application	No		0
PS-61	Is the penetration missing a bead of ADCOR ES adhesive	No		0
PS-62	Is the bead of ADCOR ES adhesive less than 1/2"	No		0
PS-63	Is the bead un-tooled w/ brush / trowel	No		0
PS-64	Was the Adcor ES applied while adhesive was wet to touch	No		0
Waterstop - ADCOR ES (ES Joints)				
PS-65	Is the ADCOR ES joint missing an overlap	No		0
PS-66	Is the ADCOR ES joint overlap less than 4"	No		0
PS-67	Does overlap fail to adchieve full contact between pieces	No		0

9.0 ELEMENT 9 INSPECTION, MEASURING AND TEST EQUIPMENT

9.0 INSPECTION, MEASURING AND TEST EQUIPEMENT

9.1 INTRODUCTION

Trade Subcontractor and supplier shall comply with this Element as required per contract documents.

9.2 INSPECTION, MEASURING AND TEST EQUIPMENT (M&TE)

- Inspection, measuring, and testing equipment required to carry out inspection and testing shall be identified, controlled, calibrated, and maintained in order to demonstrate the conformance of work to the specified requirements. Provisions shall be made for recalibration of such equipment in a timely manner and documented.

- Inspection, measuring, and test equipment used will meet the standards of accuracy for the measurements which are required. The equipment shall be calibrated according to national standards where available, and to documented standards where no national standards exist. The equipment will be recalibrated at regular intervals, and the recalibration properly documented. A record of the equipment calibration status shall be maintained by the Contractor.

- A schedule of testing equipment that needs periodic and regulatory scheduled calibration shall be required of the contractor(s) and be checked by TJPA QA Representative.

- The equipment shall be properly maintained to ensure its fitness for use. When the equipment is in use, the user shall ensure that the environmental conditions are suitable for the use of the equipment. When inspection, measuring, or test equipment is found to be out of calibration, the validity of previous inspection and test results shall be assessed and documented.

- All calibrated gauges and calibrated testing equipment must be calibrated prior to its use on the project. Periodic calibrations must be performed in accordance with certifying agency requirements and industry practice. The equipment will be properly maintained to ensure its fitness for use. When in use, the user shall ensure that the environmental conditions are suitable for the use of the equipment. When inspection, measuring, or test equipment is found to be out of calibration, the validity of previous inspection and test results shall be assessed and documented.

9.3 CONTROL OF MEASURING AND TEST EQUIPMENT

Inspection, measuring, and test equipment used shall be identified, controlled, calibrated. M&TE shall be properly calibrated and currently certified.

Calibration records and procedures shall meet the following requirements:

- Measuring and test equipment will be positively identified as to its name, calibration lab, date of last calibration and calibration expiration.
- Measuring and test equipment shall be calibrated against standards that have a known, valid relationship to national standards prior to use, and periodically thereafter, if required, to provide for the accurate reporting of quality testing and inspection results. In case no national standard exists, the basis for calibration will be identified and documented.
- The tolerances used in calibration shall be in accordance with the manufacturer's recommendation or as otherwise specified.
- An independent calibration laboratory shall perform all calibration.
- Environmental conditions for calibration shall be consistent with the location where inspection and testing is performed.
- Each subcontractor must maintain a spreadsheet for all calibrated instruments and their re-calibration dates with reminders on when the next calibration is required.
- Calibration shall be performed in accordance with approved calibration procedures. These procedures shall specify the following:
    - Details of equipment type
    - Identification number
    - Location (as required)
    - Calibration method and frequency
    - Acceptance criteria
    - Action to be taken if results are unsatisfactory

9.4 RESOLUTION OF TESTS RESULTS FROM UN-CALIBRATED EQUIPMENT

Results from tests requiring calibrated equipment performed with equipment not currently in calibration shall be suspect. The test equipment used shall be tested and recalibrated. If the equipment is found to be within calibration limits, the test

results shall be accepted. If the equipment is not found to be within calibration limits, the tests results must be verified by other means, or the material in question replaced.

9.5 TEST REPORTING

Inspection and test status are documented in BIM 360 and includes the Trade Subcontractors Daily Quality Control reports.

10.0 ELEMENT 10 INSPECTION, TEST AND OPERATING STATUS

10.1 OVERVIEW

10.2 PROCEDURE

10.0 INSPECTION, TEST AND OPERATING STATUS

10.1 OVERVIEW

Where required by the contract documents, Trade Subcontractors shall provide means for identifying the inspection and test status of work during production and installation. The purpose of this Element is to ensure that only work that has passed the required inspections and tests are accepted.

10.2 PROCEDURE

The test and inspection status shall be identified by means of markings, stamps, tags, labels, routing cards, inspections records, test software, physical location, or other suitable means.

The status identification indicates the conformance or nonconformance with regard to inspections and tests performed.

The inspection of test status of planning and design documents shall be identified by suitable means that indicate the conformance on nonconformance of product with regard to checking and review performed.

While some operations may be easily tagged in the field, in the testing lab or shop as to their inspection status, most will be recorded in the construction management BIM 360 program through status reports.

11.0 ELEMENT 11 ***NONCONFORMANCES***

11.0 NONCONFORMANCE

11.1 OVERVIEW

W/OJV and Trade Subcontractors are responsible to identify and document nonconformance issues with W/OJV expected to use BIM 360 to document QA/QC issues, FCR's and Nonconforming construction. Once a nonconformance is identified by an inspection, there is a systematic method to control the item, correct it, and ensure that project quality is not adversely impacted by the event.

11.2 NONCONFORMANCE QA ISSUES, OBSERVATIONS, REPORTING AND FIELD CONDITION REPORTS (FCR)

A Nonconformance is an item that does not meet the requirements of the project Contract Documents. Nonconforming work will be immediately segregated. Segregation may occur by physical isolation and cordoning off of work/materials, or conspicuously identified by tags/markings when physical isolation is not possible. When Nonconforming work is discovered it is determined by the QA/QC and engineer of Record to be a Nonconformance. The Webcor/Obayashi JV CQC Manager or Trade Subcontractor QC Manager will complete a Non-Conformance Report (NCR) and enter the non-conformance issue into BIM 360 for status reporting and resolution/closure tracking.

Procedures will be established and maintained to control nonconforming work, in order to ensure that such work is not inadvertently used or installed. Nonconforming work will be identified, documented, and evaluated to determine appropriate disposition. Where practicable, nonconforming items will be segregated. Those activities affected by the nonconforming work will be notified. The responsibility for review and authority for the disposition of nonconforming work will be defined in documented procedures. Disposition of nonconforming work can include reworking it to meet requirements, accepting it with or without repair, using it for alternative applications, or scrapping it. A determination to accept nonconforming work, as is or with repair, shall have the concurrence of the engineer of record. It may be advantageous to the owner to negotiate some form of compensation for accepting nonconforming work (e.g., additional spare parts).

The TJPA Representative will notify the Contractor of any detected noncompliance. Take immediate corrective action after receipt of such notice. If the Contractor fails or refuses to comply promptly, the TJPA Representative may issue an order stopping all or part of the work until satisfactory corrective action

has been taken. No part of the time lost due to such stop orders will be made the subject of claim for extension of time or for excess costs or damages by the Contractor.

Contractor shall be responsible for any Work that is non-conforming. Any required removal, repair, or replacement caused by non-conforming work shall be done by Contractor at no cost to the TJPA. Such non-conforming work will be considered as defective and payments will be withheld in accordance with Section 00 07 00, General Conditions, paragraphs 9.05 and 9.08.

Retesting required because of non-conformance to specified requirements shall be performed by the same independent firm on instructions by the TJPA representative. Contractor shall bear all costs for such retesting at no additional cost to the TJPA.

Procedures in BIM 360 will be used for tracking construction deficiencies from identification through acceptable corrective action and there the closure of the issue. Established verification procedures that identified deficiencies have been corrected.

Follow-up Phase: CQC System Manager and Trade Subcontractor QC Managers shall perform daily checks to assure control activities, including control testing, are providing continued compliance with contract requirements, until completion of the particular feature of work. Record the checks in the CQC documentation. Conduct final follow-up checks and correct all deficiencies prior to the start of additional features of work that may be affected by the deficient work. Do not build upon or conceal non-conforming work.

11.3 NON-CONFORMANCE REPORT (NCR)

When completing the Nonconformance Report, the W/OJV CQC Manager or Trade Subcontractor QC Manager shall describe the work in detail, its location, a description of the deficiency and the proposed resolution and actions taken to prevent the recurrence of the non-conformance on BIM 360. Supporting documentation shall be attached to clearly describe the issue. The report will be uploaded into BIM 360. Nonconformance Report contents are summarized as follows:

Section 1: Nonconformance identification info: Contractor, location date, etc.
Section 2: Description of Non-conformance
Section 3: Cause

Section 4: Recommended Field Engineer Disposition (Trade Subcontractor CQC Manager)
Section 5: Project Engineering Disposition (TJPA)
Section 6: Disposition Results
Section 7: Corrective action and steps taken to prevent recurrence

Process steps when responding to the receipt of an NCR's

Step 1: QC Manager/QC Specialist notifies subcontractor, in writing (email), of NCR:

Step 1a: sub to provide in response:

- Is the NCR accurate?
- No, then what is the actual field condition (w/ supporting documentation)?
- Yes, then
  - What appears to be the root cause?
  - What remedial steps can the sub perform without the engineer's approval?

Step 1b: Project Manager/QC Manager to:

- Determine if a formal RFI or CAP (corrective action plan) needs to be submitted for prior approval?
- Trade subcontractor generates the RFI to seeking direction for remedial action.

Step 2: Webcor superintendent / QC Field Specialist – review condition in comparison w/NCR

A. Determine if the NCR is accurate,
B. Determine if there are any field indications for cause of the NCR,
C. Review sub's field QC procedures and documentation of DFOW task checklist associated with the subject NCR.

Step 3: Webcor pm, qc Manager, & superintendent meet w/ sub's pm, qc Manager, & foreman to review DFOW preparatory meeting and initial install notes to determine:

A. What step was missed to allow for the NCR?
B. What lesson's learned need to be applied to avoid future NCR?
C. Determine if changes need to be made to the frequency and type of qc reviews are done for the subject scope.

Step 4: submit the cap for the NCR based on information gathered from steps 1 - 3

Step 5: to avoid future NCR of the same type:

A. Schedule an initial phase review of DFOW CHECKLIST. Each DFOW process shall identify WHAT REVIEW is done by who and when. The frequency and type of reviews for the initial installation should be more intense than the follow up phases. An NCR shall reset the clock and increase the review documentation and confirm the corrective actions have been taken.
B. Implement additional actions as determined by the cap review process.

Step 6: trade subcontractor completes the required tasks and generates an inspection request.

Step 7: populate all the pertinent blanks on the NCR form and obtain signatures for compliance...

11.4 FIELD CONDITION REPORTS (FCR)

Field Condition Report (FCR) are conditions that deviate from the approved submittals, installed incorrectly or damaged work, but may be resolved without damage to permanent installation. When completing the Field Condition Report, the Trade Subcontractor CQC Manager will describe the work in detail, its location, Specification, a description of the deficiency, and the proposed resolution and actions taken to prevent the recurrence. The Subcontractor can also provide the disposition, and proposes to close the FCR. W/O JV CQC Manager will review proposed resolution on BIM 360 and either request for TJPA to close it or request for additional information from Sub QC Manager till the issue is resolved in a timely Manner.

Process Steps for writing and closing an FCR issue and the process for completing a NCR

Step 1: A FCR is identified and written by:

a) Observation - Webcor CQC Manager, superintendent/QC Field Specialist or TJPA representative monitoring the work observes a quality issue and create a QC/QA issue in BIM 360.

b) Task checklist - Webcor superintendent/QC Field Specialist is completing a DFOW checklist and observes an issue and creates FCR issue in BIM 360
c) Inspection request (Tasks) – When an inspector rejects an inspection request, a FCR is generated in BIM 360 and linked to the Inspection Request.

Step 1a: When FCR escalates to an NCR:

a. FCR's point to a systemic issue
b. Ignored FCR's (30, 60, 90 days)
c. Latent Issue
d. Corrective Action Plan (CAP) or RFI is required

Step 2: A QC/QA and FCR issue is closed by:

a) Stating the cause of the issue and proposes a corrective action plan (CAP) and submits the CAP in BIM 360.
b) Documents the corrective action taken in BIM 360.
c) Documents the cause and actions taken to prevent recurrence in BIM 360.

Step 2a: A NCR is closed by:

a. Submit the Corrective Action Plan (CAP) for the NCR,

Step 3: To avoid future NCR of the same type:

a) Schedule an Initial Phase Review of DFOW checklist. Each DFOW process shall identify what review is done by who and when. The frequency and type of reviews for the initial installation should be more intense than the follow up phases. An NCR shall reset the clock and increase the scrutiny to review documentation and confirm the corrective actions have been taken.
b) Implement additional action as determined by the CAP review process.

Step 4: Trade Subcontractor completes the required tasks and generates an Inspection Request.

Step 5: QC Manager populate all the pertinent blanks on the NCR Form and obtain signatures for compliance.

11.5 NONCONFORMANCE AND FIELD CONDITION REPORT LOG

The project-wide Non-Conformance Tracking Log in Autodesk BIM 360 is maintained by the TJPA Construction Management Oversight. Webcor/Obayashi JV and the Trade Subcontractors will maintain Non-Conformance logs appropriate for their scope of work.

11.6 CONTROL THE CONTINUATION OF WORK

After the item of work is identified and segregated from all other active work, the W/O JV CQC Manager or Trade Subcontractor QC Manager will determine if work can continue in the affected area. When continuing work can adversely affect quality or hide the defect, work must stop in the affected area until the disposition of the item is resolved. The W/OJV CQC Manager identifies and clearly labels the limits of the affected stop work areas. Non-conforming work may be reworked to meet requirements, accepted as is, repaired, or rejected. If accepted as is or repaired, the Engineer of Record needs to approve the deviation from original specifications. Nonconforming work may require an approved Corrective Action Plan.

12.0 ELEMENT 12 CORRECTIVE ACTION

12.1 INTRODUCTION

12.1 CORRECTIVE ACTION AND CORRECTIVE ACTION PLANS

12.0 CORRECTIVE ACTION PLAN

12.1 INTRODUCTION

The following CAP procedure shall cover all construction operations, both onsite and offsite, including work by Trade Subcontractors and Suppliers. Procedures for tracking construction deficiencies from identification through acceptable corrective action. Establish verification procedures that identified deficiencies have been corrected."

12.2 CORRECTIVE ACTION AND CORRECTIVE ACTION PLANS (CAP)

Corrective action procedures should be established, documented, and maintained. These include procedures for investigation of the cause of nonconforming work and the corrective action needed to prevent recurrence, and procedures for analysis to detect and eliminate potential causes of nonconforming work. This element also includes implementing and recording changes in procedures resulting from corrective action.

Once a NCR cause has been determined, a written Corrective Action Plan (CAP) will be submitted by W/OJV in order to resolve and close the NCR. The CAP will be written by the Trade Subcontractor QC Manager and submitted to W/OJV's CQC Manager who will review and post to Constructware after sign-off. W/OJV QC Manager or Trade Subcontractor QC Manager will attach the submitted CAP to the NCR in BIM 360 Systems for tracking. Once CAP is approved, the CAP will be implemented by the Trade Subcontractor.

Corrective action procedures shall be established for:

- Investigating the cause of the nonconforming work and taking the corrective actions needed to prevent recurrence
- Analyzing the CAP processes to detect and eliminate potential causes of nonconforming products.
- Initiating preventative actions to deal with problems to a level corresponding to the risks encountered
- Ensuring that corrective actions are taken and that they are effective

- Implementing and recording changes in procedures resulting from corrective action

13.0 ELEMENT13 ***QUALITY RECORDS***

13.1 INTRODUCTION

13.2 DOCUMENTATION

13.3 REPORTING

DAILY REPORTS

MONTHLY REPORTS

PERIODIC FORMS, REPORTS AND LISTS

13.4 DFOW QC REPORTING FOLDER FILES STRUCTURE FOR CONSTRUCTWARE

W/OJV DAILY CQC REPORT FORM

NONCONFORMANCE REPORT FORM

13.0 QUALITY RECORDS

13.1 Introduction

Procedures are established and will be maintained for quality records. These procedures will identify which records shall be kept, responsibility for production and collection, and responsibility for indexing, filing, storage, maintenance, and disposition of quality records..

Quality records shall be maintained to show achievement of quality objectives and appropriate functioning of the Quality Management System. Supplier, contractor, and subcontractor quality records shall be included when pertinent, as defined by requirements agreed upon during DFOW Preparatory Meeting, based Specifications and Codes. Quality records shall be legible and specify the work involved. They shall be kept in an environment to minimize deterioration and damage. Retention times and final disposition shall be established and recorded.

The following types of Quality records requiring control:

- Inspection reports – (Code required inspection reports are uploaded by TJPA's QA team to BIM 360 and Constructware.) Trade subcontractors Reports are attached to Daily QC reports.
- Test Data – Code test uploaded by TJAP to BIM 360. Non-code tests are required per specs are included as part of Daily QC reports.
- Qualification records (BIM 360)
- Calibration Records (BIM360)
- Nonconformance (BIM 360)
- Corrective Actions (BIM 360)
- Daily QC reports with back up data and Documentation
- Material identification / batch tickets

13.2 Documentation

Each Subcontractor is required to produce a QC Daily Report within 3-4 days must include all sub tier documentation (Delivery tags, material traceability and heat number tags). W/O JV shall generate CQC Daily Reports that indicates inter-action with Subcontractor's process in establishing Quality installation, inspection,

and documentation. DFOW checklists are used to identify items that require special attention and document any daily occurrences in QC Daily Reports

Maintain current and complete QC reports providing evidence that required quality control activities and tests have been performed. Include in these records the work of Trade Subcontractors and Suppliers on an acceptable form.

Address deficient features and include a statement that equipment and materials incorporated in the Work and workmanship comply with the Contract. Furnish these reports to the TJPA Representative daily within 5 working days after the date covered by the report. Reports must be signed and dated by the CQC System Manager. Include copies of reports prepared by all subordinate quality control personnel within the CQC System Manager's report
.
The W/OJV CQC will review for completeness, clarity and accuracy of W/O CQC staff or Trade Subcontractor reports.

Weekly meeting with key Trade subcontractors QC Manager will go over key QC issues to ensure timely QC reports are submitted on regular bases.

13.3 REPORTING

Daily Reports

- Webcor/Obayashi JV Daily CQC reports (see attached)
- Trade Subcontractors Daily CQC reports

Monthly Reports

- Webcor/Obayashi JV Construction Monthly Report
- Webcor/Obayashi JV CQC Managers Monthly Status Report (included in the Construction Monthly Report

Periodic forms, reports and lists

- Definable Features of Work (DFOW) list per Trade Subcontractor (in W/OJV F: drive, Constructware and hard copies in section: Tab/Element 7).
- Non-Conformance Report (see attached)

13.4 DFOW QC Reporting Folder Files Structure for Constructware

The CQC File Structure is outlined below and will be utilized on this project to store, organize and manage W/OJV Daily CQC Reports and DFOWs. In Constructware

DFOW folder and file structure:

Each trade package has a folder and each DFOW has a subfolder with subsequent subfolders. The folders and files are managed by CM/GC Quality Control Manager and CM/GC Document Control. Files are located in File Management/File Director by Project. This arrangement puts all the records for each DFOW in one folder. It becomes the quality record for that DFOW.

- 10 Quality
  - 13 Definable Feature of Work (DFOW)
    - BSE- TG03- BBI
    - DFOW log
    - DFOW (By Number and Title)
      - Preparatory Phase
        Preparatory Phase documents are filed in this folder.
      - Initial Phase
        Initial Phase documents are filed in this folder.
      - Follow-up Phase
        Follow-up documentation is appended to Daily QC Reports and filed in this folder by number and date.
      - DFOW Record Documents
        As the work is completed but no later than after completion of the DFOW all quality records would be assembled and filed in this folder. In the event of an audit or record search this folder would contain all the records. Subfolders may be added as needed.
        - Material Records
        - Installation Records

CQC Daily Reports folder and file structure:

Daily CQC Reports are prepared and filed in folders by date. Each folder contains the CM/GC QC Manager's Daily Report and all the Trade Contractors' QC Managers' Daily Reports. The folders and files are managed by CM/GC Quality Control Manager and CM/GC Document Control. Files are located in File Management/File Director by Project. This arrangement puts all the Daily QC reports for each day in one folder. It becomes the quality record for that day.

- 10 Quality
  - 12 CQC Reports
  - Year
    - Month
      - Day (By Contractor- year/month/day (i.e. BBI-13/08/29 OR 20130829)
      - CM/GC QC Daily Report
        This report is prepared by the CM/GC QC Manager
      - TCQM Daily Report (Identified by Trade Package)
        This report is prepared by each Trade Contractor QC Manager and submitted to the CM/GC Quality Control Manager for review and filing.

14.0 ELEMENT14. ***QUALITY AUDITS***

14.0 QUALITY AUDITS

14.1 QUALITY AUDITS

The Trade Subcontractor QC Manager reports to the Webcor /Obayashi JV CQC Manager and oversees the trade specific implementation of the quality control program and whose primary responsibility will be to implement the Trade Subcontractor's quality control plan. The Trade Subcontractor QC manager will certify that the Trade Subcontractor's work is in compliance with the Contract Documents and complies with the Webcor/Obayashi Joint Venture Quality Control Plan and all quality control requirements contained in the Contract Documents, including specification section 01 14 00 Quality Control. The Trade Subcontractor QC Manager shall:

- Support and facilitate QMS Audit process by TJPA, FTA, and Agency Audits.

15.0 ELEMENT 15 ***TRAINING***

15.1 TRAINING

15.0 TRAINING

15.1 TRAINING

Webcor/Obayashi JV will ensure that only knowledgeable capable employees carry out the planning and execution of the work.

- ***The W/OJV CQC Manager will provide and document training.*** Under the Direction of the W/OJV CQC manager the Trade Subcontractor QC Managers will provide training on the elements of the W/O JV and Trade Subcontractors site specific Contractor's Quality Control Plans to all trade subcontractor staff having CQC responsibilities.
- When specified in the Contract Documents, Trade Subcontractor CQC Managers will submit proof of tradespersons qualifications including licensing requirements, certifications or other required training qualifications for the specified task to Webcor /Obayashi JV and the TJPA.
- When specified in the Contract Documents, project or task specific training will be documented by the Trade Subcontractor. The Trade Subcontractor will provide Webcor/Obayashi JV with a copy of the training syllabus and list of attendees.
- Webcor/Obayashi JV Quality Control personnel will complete the U.S. Army Corps of Engineers/U.S. Navy Facilities Engineering Command, Construction Quality Management for Contractors
- The Trade Subcontractor QC Managers will maintain records of quality training for their personnel. The Webcor/Obayashi JV CQC Manager will maintain records of quality training for Webcor/Obayashi JV personnel.
- W/OJV continues to revise Superintendents and QC field staff procedures to improve on records and reports for field issues such as Material, installation, FCR's, and NCR's.
- As part of each DFOW's meeting process a DFOW checklist will be established and will determine the requirements for each DFOW checklists.
- W/OJV shall conduct training for Superintendent and QC staff to clarify DFOW requirements as well as what issues should be tracked and raised to the status of Field Condition Reports.
- W/OJV will conduct work sessions with TJPA QC representative and W/O Superintendents to clarify, when and who shall issue FCR's and/or NCR's.

- Training of personal on the proper procedures to complete a DQC report.

Appendices

1 REGULATORY SETTING

The Transbay Transit Center Project (Project) meets federal Clean Water Act (CWA) and State Porter – Cologne Water Quality Control requirements via connection to the combined wastewater and stormwater sewer system operated by the San Francisco Public Utilities Commission (SFPUC) under a State Water Resources Control Board-issued National Pollutant Discharge Elimination System (NPDES) permit (Order No. R2-2002-0073, NPDES Permit No CA0037664). The Project is therefore not subject to coverage under the California Construction General Stormwater Permit (Order 2009-0009-DWG), that became effective on July 1, 2010; however, the construction site must implement Best Management Practices (BMPs) to prevent pollutant discharge into the combined sewer to comply with the San Francisco municipal ordinances and codes described below. This Construction Stormwater Pollution Control/Compliance Plan provides a delegation strategy along with best management practice (BMP) categories for compliance with stormwater regulations covering construction activities at the Project.

San Francisco Ordinance

San Francisco has a Stormwater Discharge Controls Ordinance requiring Pollution Prevention Procedures during any construction conducted in the City of San Francisco. In general the ordinance discusses long term BMPs such as rain gardens and green roofs particularly applicable to redevelopment areas and sections of the City serviced by small municipal separate storm sewer systems (MS4); however aspects of the ordinance apply to construction activities. For example, although coverage under the NPDES General Construction Permit (Water Board Order No. 99-08-DWQ) is not required for projects in those areas of the city that drain to the combined sewer system; all construction sites must implement BMPs to prevent illicit discharge into the combined sewer. Generally, City requirements include the development of a Storm Water Pollution Prevention Plan (SWPPP), SWPPP plan review by SFPUC, stormwater treatment measures, runoff monitoring, and frequent site inspections. The regulations also require the use of construction period (and operational period) BMPs on construction sites to keep pollutants (sediment and construction site debris), out of water conveyance systems, the treatment plants, and discharge points.

San Francisco Public Works Code

The federal CWA requires that publicly-owned treatment works (POTW) regulate the discharge of industrial wastes into a sewer system subject to NPDES permit requirements, and since construction activity is regulated under the industrial category, San Francisco's department of public works (DPW) has adopted requirements for construction discharges to the combined sewer system. Under DPW regulations, discharges of construction storm water as well as any wastewater (such as dewatering from construction sites) is subject to the requirements of Article 4.1 of the San Francisco Public Works Code, which regulates the quantity and quality of discharges to the combined sewer system. Projects that conduct any dewatering activity are required to apply for a Wastewater Batch Discharge Permit from the SF PUC WWE_CSD. Information on the Batch Discharge Permit and pre-treatment can be found online at: **http://sfwater.org/msc_main.cfm/MC_ID/14/MSC_ID/445.**

Order No. 158170 of the San Francisco DPW provides additional pre-treatment industrial waste discharge limits to augment those listed in Article 4.1. The San Francisco Municipal Code requires contractors to have a Sediment and Erosion Control Plan for projects that discharge to the Combined Sewer System.

RESPONSIBLE PARTIES

The legally Responsible Party for the Project is the Transbay Joint Powers Authority (TJPA). The TJPA consists of a collaboration of Bay Area government and transportation agencies, and is managed by TJPA staff and overseen by a Board of Directors. For site-specific concerns that can be addressed by TJPA, please call **415.409.TJPA (8572)**.

Webcor /Obayashi is a joint venture contracting group hired by TJPA as general contractor for the Transbay Terminal Center Phase of the Project. Webcor /Obayashi will be subcontracting construction to Trade Subcontractors who will be responsible for preparing SWPPPs specific to their construction activity, schedule, discharge points, types of pollutants and construction boundaries. The Trade Subcontractors will be responsible for preparing and submitting for approval a SWPPP including furnishing, installing, maintaining and removing BMPs such as silt fence, filter boxes, construction entrances, sediment traps, dust control, dewatering and other erosion and sediment control measures during construction to prevent contamination of storm water from construction activities and to maintain compliance with the SF storm water ordinance and codes. For site-specific NPDES concerns that can be addressed by Webcor/Obayashi, please call **415.978.5726**.

2 PROJECT INFORMATION

2.2 Project Description

The Project is located generally between Second Street in the west, Beale Street in the east, Natoma Street in the south and Minna Street in the north (Figure 1). The Project is part of a larger $4 billion transportation and housing expansion/redevelopment effort that will replace an old Transbay Terminal at First and Mission streets with a modern regional transit hub connecting eight Bay Area counties and the State of California through 11 transit systems: AC Transit, BART, Caltrain, Golden Gate Transit, Greyhound, Muni, SamTrans, WestCAT Lynx, Amtrak, Paratransit and future High Speed Rail from San Francisco to Los Angeles/Anaheim.

The entire Project consists of three broad activities as noted below. Webcor /Obayashi are the general contractors and have prepared this Construction Stormwater Pollution Control/Compliance Plan to provide for compliance with stormwater regulations covering construction activities.

- **Utility Relocation**
- **Train Box and Transit Center Building Construction**
- **Bus Ramp Construction**

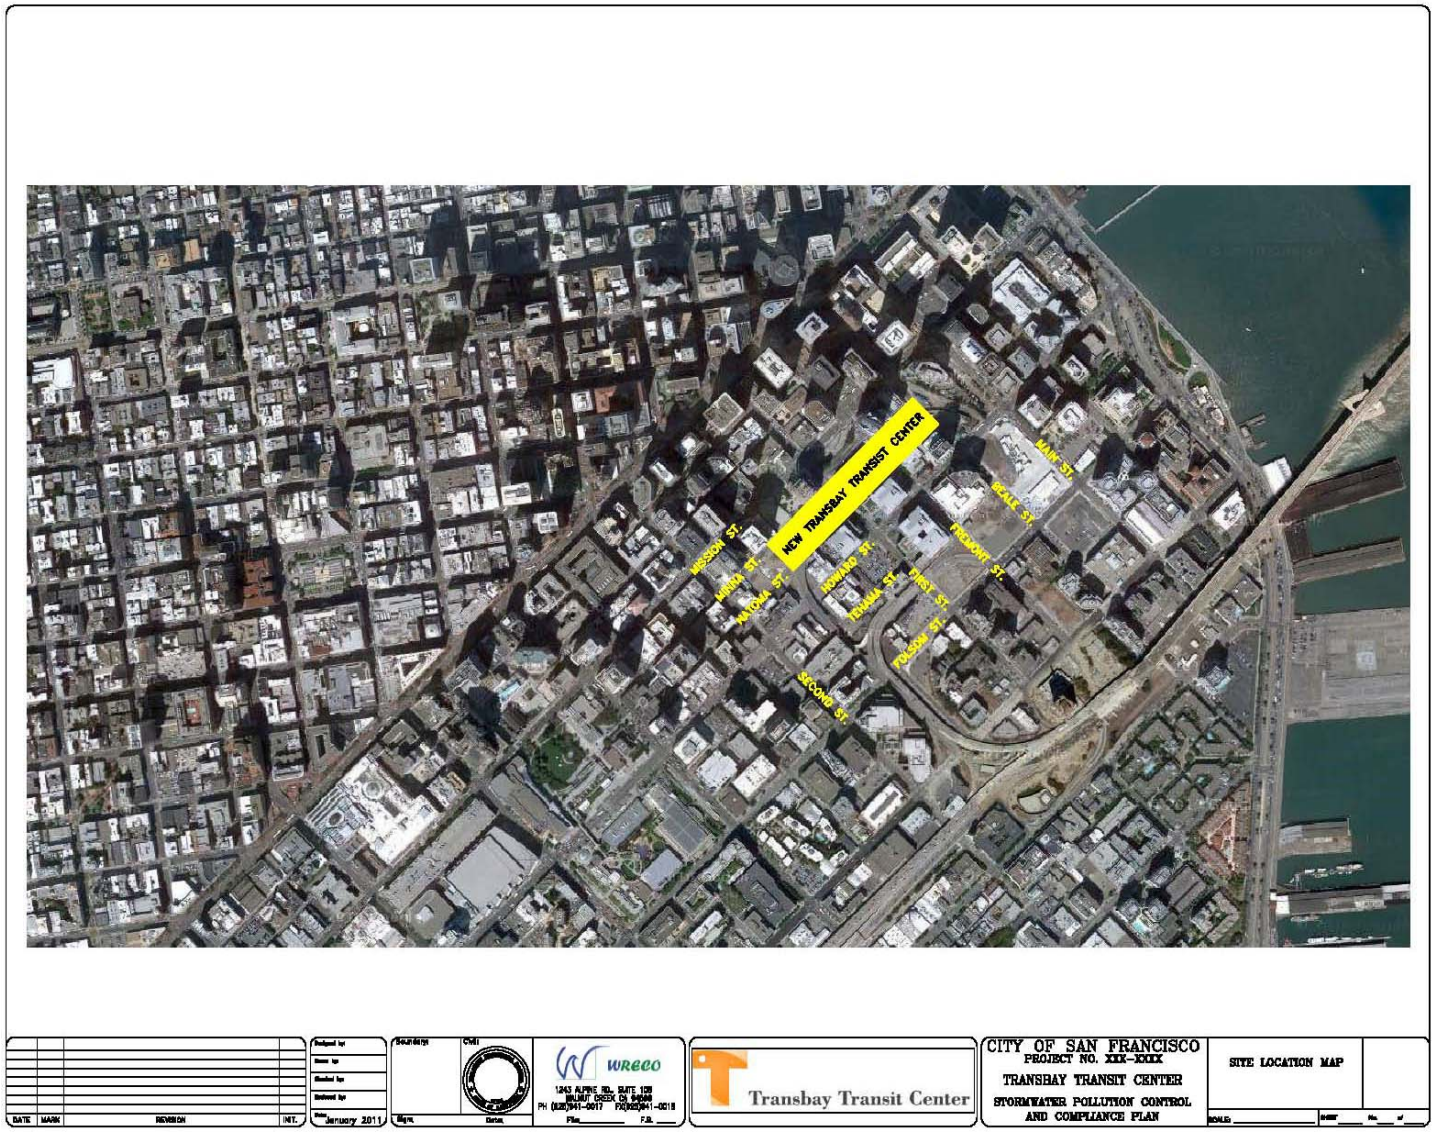

Figure 1. Project Location Map

2.3 Project Size and Total Disturbed Area

The estimated total disturbed soil area (DSA) for the Project is approximately 12.3 acres and includes the areas where the soil might be potentially disturbed by construction activities, as follows:

Table 1. Total Land Disturbance

Area Name	Approximate Area Disturbed (Acres)
Zone 1	2
Zone 2	1.8
Zone 3	1.5
Zone 4	4
Linear Utility Relocation	2.5
Additional Staging/Disturbance	3
Total	12.3

Figures 2 and 3 show general locations for the DSA construction zones and linear utility relocation trade packages. Several staging areas are anticipated during the life of the Project as shown in Figure 4.

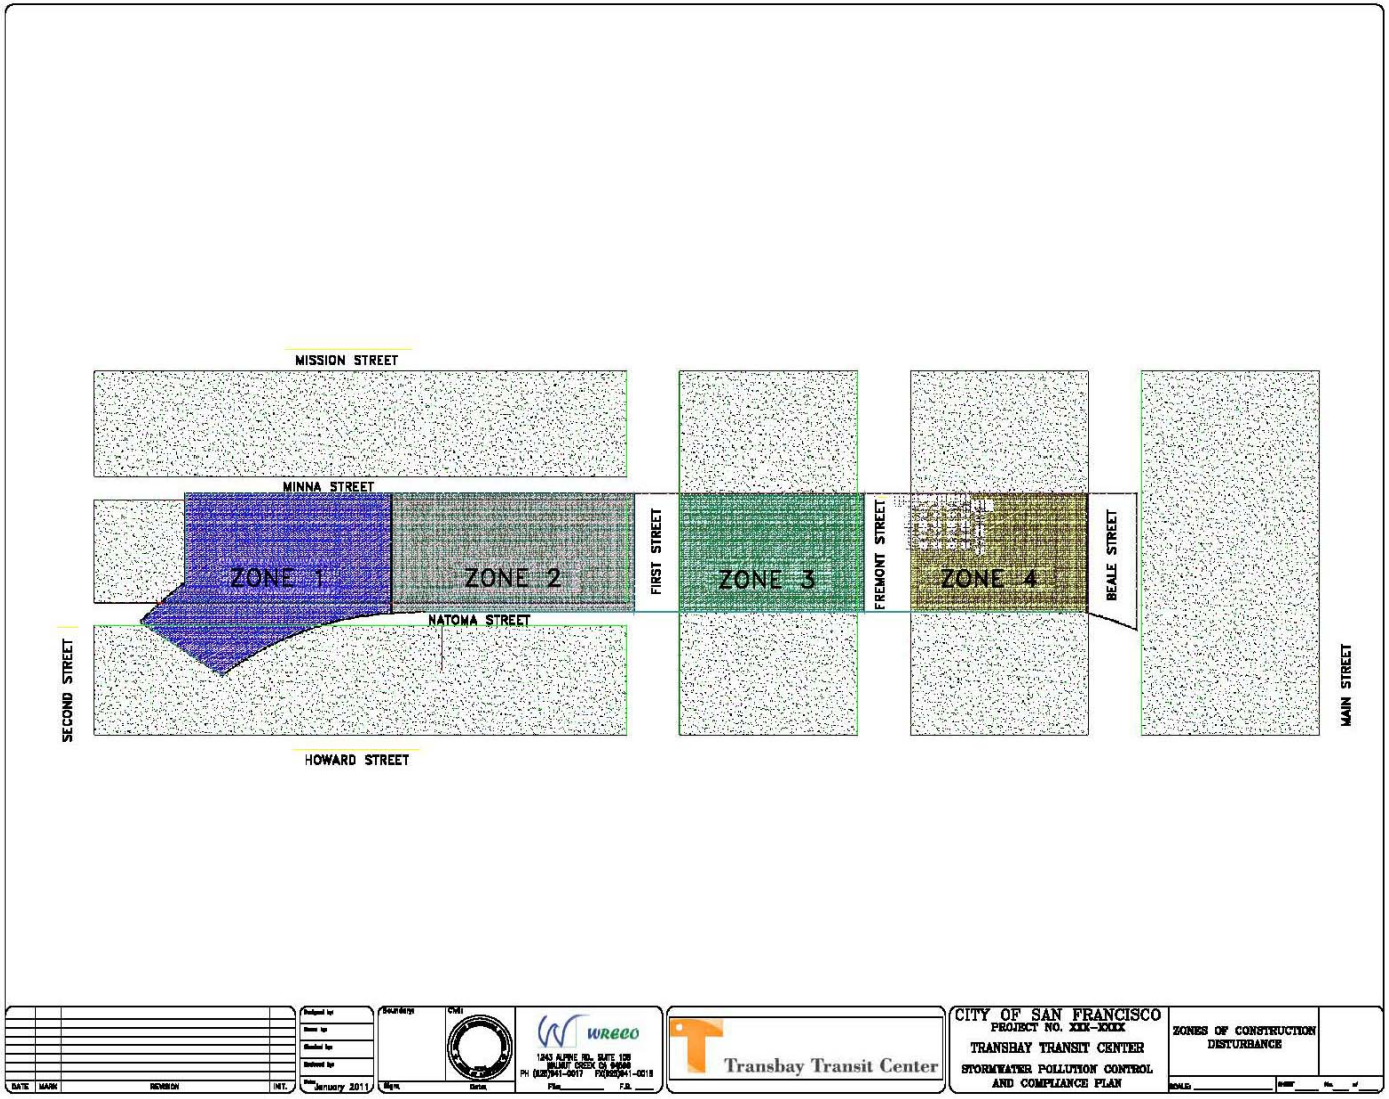

Figure 2. Construction Zone Locations

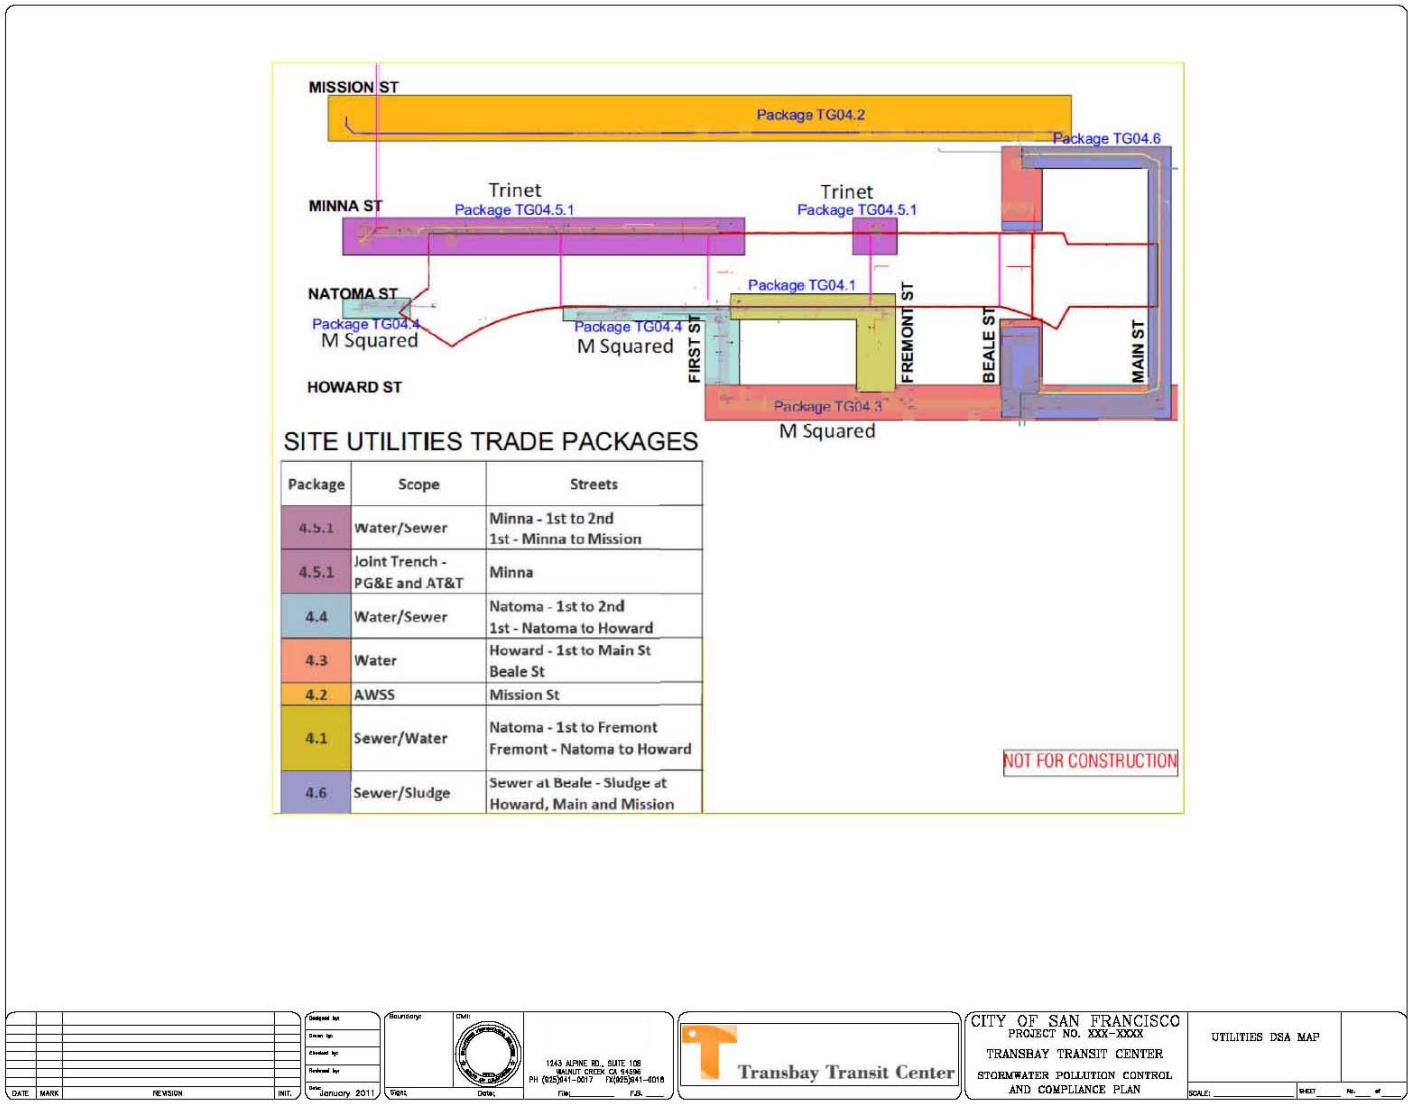

Figure 3. Utilities DSA Map

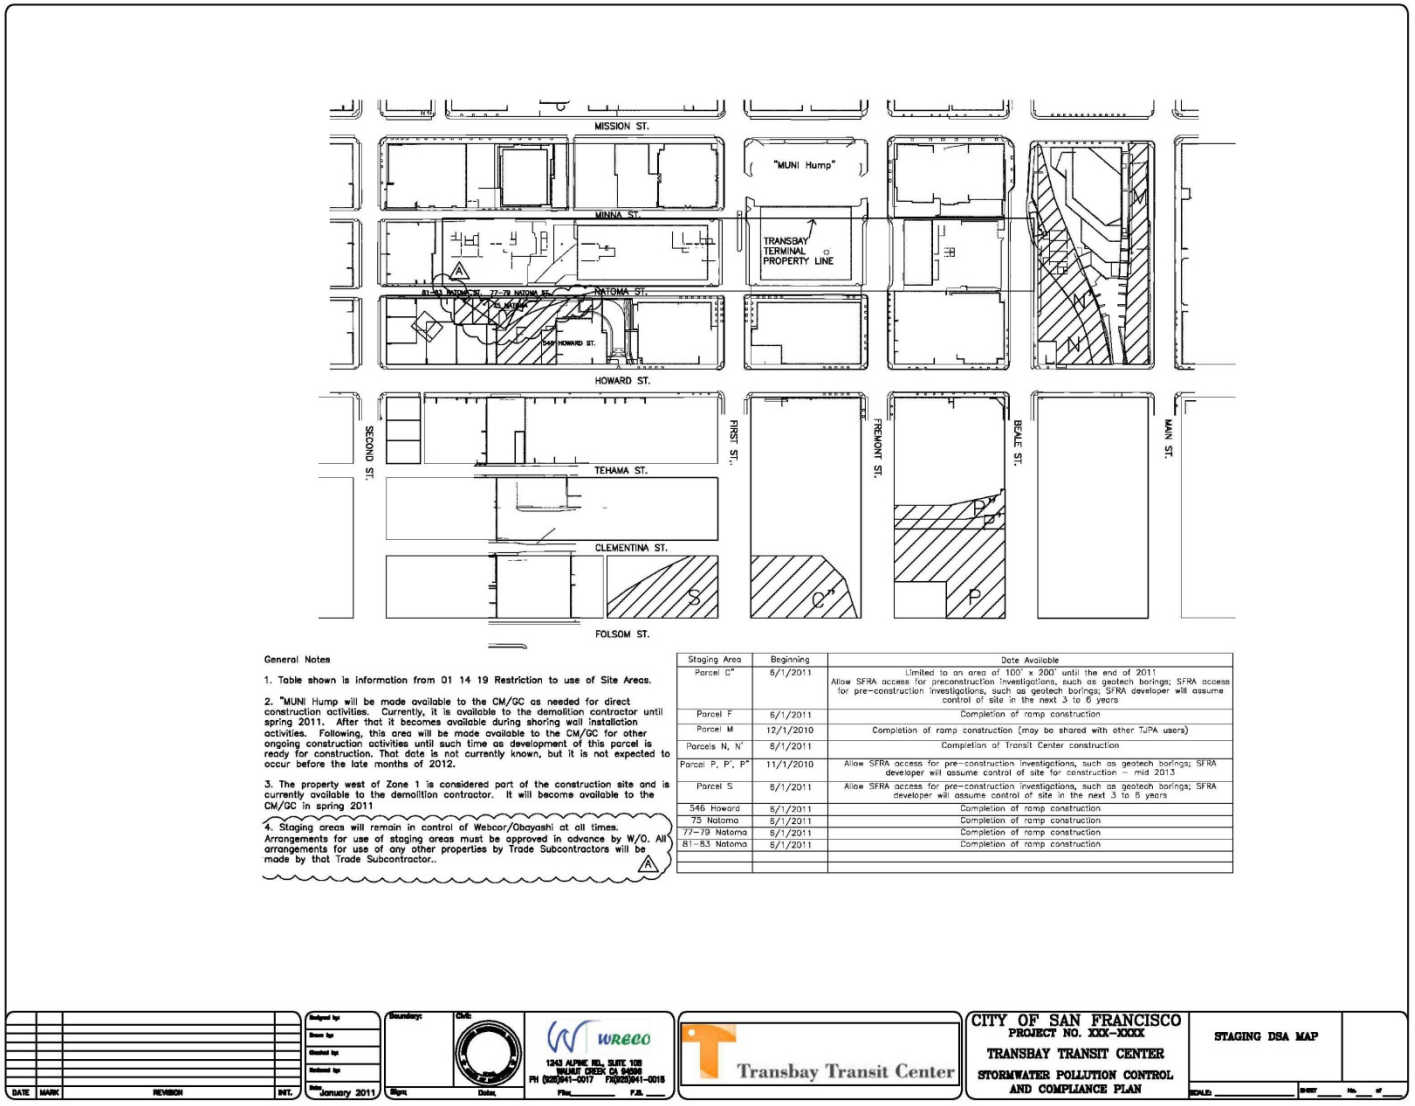

Figure 4. Staging DSA Map

2.4 Receiving Waters and Environmentally Sensitive Areas

The Project is located within the northeastern section of the City of San Francisco. The Project does not discharge directly to jurisdictional "receiving water." The San Francisco combined sanitary/storm water sewer system collects all storm and waste water discharging in the Project vicinity and pipes the water to the Southeast Water Pollution Control Plant for processing and discharging under NPDES Permit No CA0037664. The SE plant currently treats runoff to secondary treatment standards established by the USEPA, meeting or exceeding water quality objectives in San Francisco Bay.

The San Francisco Bay Area has a climate characterized by wet winters and dry summers. Average annual rainfall in the area is approximately 20 inches. The majority of this rainfall generally occurs from November through April with little rainfall during the remaining months of the year. Construction for the Project will span a period of several years including both wet and dry seasons. The project does not impact any known environmentally or culturally sensitive areas. For information regarding any environmentally sensitive habitat concerns, please refer to the Biological Resource Assessment. For information on cultural or other CEQA or NEPA requirements, please refer to the appropriate State or Federal Agency.

2.5 Construction Activities and Schedule

The Project activities include but are not limited to clearing, excavation and backfill, construction and finishing work within a busy city environment with established infrastructure. Several staging areas are anticipated during the life of the Project. Construction equipment and materials will be stored both onsite and at staging areas. As a result, fueling and maintenance, as well as welding and fabrication, may take place onsite. A discussion of the pollutants with potential to contact storm water as a result of these activities is included below. Since demolition of the existing ramps and terminal is currently underway by another contractor (Evans Bros Inc), the first phase of the Webcor-Obayashi Project includes utility relocation, followed by subexcavation in preparation for construction of the Transit Center Building/Train Box. Construction overseen by Webcor-Obayashi will create a new five-story Transit Center with one above-grade bus level, ground-floor, concourse, and two below-grade rail levels serving Caltrain and future California High Speed Rail, and includes new bus ramps to connect the Transit Center to a new off-site bus storage facility and the SF-Oakland Bay Bridge. Construction of the Project should be completed within or near the year 2017.

The following list generally outlines the expected Project construction schedule:

1. Utility relocation November 2010-September 2011.
2. Protection of perimeter: March 2011.
3. Trade Subcontractors awarded contracts: April 2011.
4. Activity specific SWPPPs submitted by Trade Subcontractors: April 2011.
5. Sediment control products ordered and stored on site by Trade Subcontractors: May 2011.
6. Stabilized construction entrance, equipment parking, covered storage and any concrete wash areas constructed by Trade Subcontractors: May 2011.
7. Excavation and Dewatering by Trade Subcontractors: May 2011-April 2014.

8. Transit Center Building Construction: May 2013-August 2017.
9. Bus Ramps: 4th quarter 2012-4th quarter 2014.
10. Construction of the concrete form box and train box by Trade Subcontractors: TBD.
11. Vertical Construction by Trade Subcontractors: 2013-2017.
12. Monitoring and Maintenance of BMPs: Entire construction timeline by Trade Subcontractors.
13. All BMPs functional: Entire construction timeline.

2.6 Potential Construction Site Pollutant Sources

Potential materials expected from the project include, but are not limited to, excavated soil, oil products (gasoline, diesel, hydraulic oil, and kerosene), solvents, concrete and curing compounds, and other construction materials. Construction on the project site will require temporary disturbance of surface soils and removal of existing on-site pavements and subsurface structures. During the construction period, excavation and grading activities will result in exposure of soil to water runoff, and the use of haul trucks that could track material away from the construction site. Much of the excavated material will be typical of coarser sandy soil particles that do not mobilize easily. However, some of the material may consist of relatively mobile fine sediments (silt and clay). Most excavation will occur in a below-grade pit which will drain internally and contain storm water; however construction activities will impact areas outside of the excavation areas that drain toward the San Francisco combined sewer drain inlets. Water in excavation pits from rainfall and groundwater seepage would contain sediment. Removal of the pit water will probably require sediment removal before it can be discharged into the storm drains (see SF PW Code paragraph above).

Soil and debris on the haul truck tires exiting the site could be deposited on local streets and Transport in storm water into the storm drain. The majority of construction debris and materials would be loaded onto trucks within the interior of the construction boundaries, rather than from public sidewalks or streets bordering the project site. The construction debris and materials would then be hauled off site. Therefore, soil stockpiles would be minimized on site.

In addition to sediment, Table 2 lists expected construction materials that could generate pollutants, describes their chemical and physical properties, and identifies potential pollutants associated with them. This list should be updated as the project proceeds and additional phases begin.

Table 2. Potential Stormwater Pollutants

Source	Chemical/Physical Description	Storm Water Pollutants*
Diesel Fuel	Clear, blue-green to yellow liquid	TPH-diesel, benzene, toluene, ethylbenzene, xylenes, naphthalene
Concrete Work	Cement, fly ash, aggregate	pH
Oil and Grease	Brown oily petroleum	TPH-motor oil, oil and grease
Used Oil (oil only)	Brown oily petroleum	TPH-motor oil, oil and grease, LUFT 5 metals (cadmium, chromium, lead, nickel, and zinc)
Excavated and Stockpiled Soil	Solid particles	Soil, sediment
Gasoline	Colorless, pale brown or pink petroleum hydrocarbon	TPH-gasoline, benzene, toluene, ethylbenzene, xylenes. For "old" releases, include DIPE; ETBE; MTBE; TAME; TBA; 1,2-dibromoethane (1,2-DBA); and 1,2-dichloroethane (1,2-DCA)
Hydraulic Oil/Fluids	Brown oily petroleum hydrocarbon	TPH-hydraulic oil, benzene, toluene, ethylbenzene, xylenes, LUFT 5 metals (cadmium, chromium, lead, nickel, and zinc)
Sanitary/Septic Waste	Sewage products	Coliform, *E. coli*, viruses, solvents (i.e. volatile organic compounds such as trihalomethanes and the dichlorobenzene isomers), nitrate
Trash; Windblown and Other	Paper, pipe, electrical wires etc.	Paper, pipe, electrical wires etc.

Notes: *****TPH-gasoline = total petroleum hydrocarbons quantified as gasoline (the same pattern for TPH-diesel, TPH-motor oil, TPH-hydraulic oil)
BTEX = benzene, toluene, ethylbenzene, and xylenes
DIPE = di-isopropyl ether
ETBE = ethyl tertiary butyl ether
MTBE = methyl tertiary butyl ether
TAME = tertiary amyl methyl ether
TBA = tertiary butyl alcohol
LUFT = leaking underground fuel tank
PCBs = polychlorinated biphenyls

Pollutants of concern in the San Francisco Bay include, but are not limited to, mercury, diazinon and Polychlorinated Biphenyls (PCBs). These chemicals are not easily broken down and they tend to adhere to particles of sediment, so can be removed from stormwater in BMPs that trap sediment. For this reason, sediment trapping BMPs are highlighted in the treatment controls listed for the project. Additional pollutant categories that can be anticipated in stormwater leaving the project include oil and grease, trash, sediment, organic compounds, pesticides, nutrients and metals.

2.7 Identification of Non-Storm Water Discharges

Non-storm water discharges include a wide variety of sources and may contribute pollutant loads if not controlled. They can include, but are not limited to:

- discharges of process water
- saw cutting slurry
- air conditioner condensate
- non-contact cooling water
- vehicle wash water
- sanitary wastes concrete washout water
- paint wash water
- irrigation water
- pipe testing water
- natural groundwater seepage

Measures to control spills, leakage, and dumping, and to prevent illicit connections during construction must be addressed through structural as well as non-structural BMPs. Certain non-storm water discharges may be necessary for the completion of construction projects. Authorized non-storm water discharges may include those from de-chlorinated potable water sources such as: fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, uncontaminated ground water dewatering, and other discharges not subject to a separate general NPDES permit adopted by a region. Authorized non-storm water dewatering discharges require a permit. Information can be found online at: **http://sfwater.org/msc_main.cfm/MC_ID/14/MSC_ID/445.**

Each Trade Subcontractor is responsible for procuring the necessary dewatering permits for construction activities undertaken. The SFPUC prohibits the discharge of storm water that causes or threatens to cause pollution, contamination, or nuisance.

Additionally, all SWPPPs prepared by Trade Subcontractors must include procedures and practices designed to minimize or eliminate the discharge offsite of pollutants from vehicle and equipment cleaning, fueling, maintenance operations and other non-storm water. Project monitoring by trade Subcontractors will include a visual check for non-storm water discharges and non-storm water discharge potential.

3 BEST MANAGEMENT PRACTICES (BMPS)

BMPs shall be implemented as listed in this Plan and additionally as necessary to adequately minimize erosion on site and limit sediment transport off site to an acceptable level in accordance with the SFPUC regulations and all City Codes and Ordinances.

Erosion and sediment control measures are needed throughout the year on the Project. In particular, stormwater catch basins must be protected year round. During dry season development, BMPs will be primarily designed to mitigate the movement of sediment and pollutants off site by tracking from grading equipment and from wind. Wet season BMPs are designed to prevent soil from washing off graded areas during rainy periods, tracking of soil and pollutants off site by vehicles and any other movement of pollutants from the Project.

3.2 BMP Objectives

This Construction Stormwater Pollution Control/Compliance Plan provides the following BMP objectives:

- Provide overall guidance to Trade Subcontractors in preparing SWPPPs and dewatering plans specific to their construction activities, construction timelines and drainage areas for submittal to the SFPUC.
- Delineate typical construction pollutants and their sources, including sources of sediment associated with construction, construction site erosion and other activities associated with anticipated construction activity. Trade Subcontractors are expected to expand and amend the information provided here within to tailor their SWPPPs to their activities.
- Outline best management practice (BMP) categories that need to be included in the SWPPPs prepared, submitted and maintained by the Trade Subcontractors to a level that results in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from construction activity to the standard required by the SFPUC.

BMPs categories listed in this Construction Stormwater Pollution Control/Compliance Plan should be reviewed by the Trade Subcontractors, added to their SWPPPs as applicable and additionally installed, maintained, monitored and reported as practicable to adequately minimize erosion on site and limit sediment transport off site to an acceptable level. Adjustments and modifications to the BMPs identified in this Plan need to be implemented by the Trade Subcontractors as necessary to maintain the construction site in accordance with the provisions of the SFPUC regulations and all City Codes and Ordinances.

The SFPUC identifies the following list of BMPs and pollution prevention measures that must be implemented at all construction sites:

- Identify all storm drains and catch basins near the construction site and ensure all workers are aware of their locations to prevent pollutants from entering them.
- Protect all storm drain and catch basin inlets.
- Develop an erosion control and sediment control plan for wind and rain.
- Develop spill response and containment procedures.
- Inspect site regularly to ensure that BMPs are intact.

- Conduct daily site cleanings as needed.
- Educate employees and subcontractors about BMPs.
- Regularly maintain all BMPs at project site.

3.2.1 Erosion Control BMPs

Erosion control practices consist of source control measures designed to prevent soil particles from becoming dislodged and transported in storm water runoff, while sediment control measures filter and otherwise recover soil particles from runoff. Erosion control BMPs protect the soil surface by covering and/or binding soil particles and in many cases, are more effective, less expensive, and require less maintenance and repair. Although they typically function by protecting the surface of exposed soil, erosion control measures cannot be effectively applied until grading activities are complete or idle.

At the Project, erosion is expected to occur primarily as a result of pavement removal, soil disturbance and subsequent wind or rain. For this reason, BMPs to limit the timing of soil disturbance and provide timely stabilization for the disturbed soil surface should be the focus of erosion control efforts for the site. Erosion control BMPs such as scheduling and non-vegetative soil stabilization (soil binders) should be considered by each Trade Subcontractor (TS) and added to their SWPPPS to control soil erosion on the construction site. Modifications to the BMPs may be necessary should construction activities or the construction schedule be altered. If modifications are needed to the BMPs, the Trade Subcontractor should work with the SFPUC to amend the SWPPP and Erosion Control BMPs to satisfactorily meet City storm water regulations.

Scheduling should be implemented throughout the project as a means of ensuring that significant earth-disturbing activities are avoided if rain is forecasted. If there are exposed areas that are not being actively worked the trade Subcontractors should consider stabilizing all areas as practical. If additional information or instructions are needed for BMP installations, the CASQA website and cutsheets can be found at: **www.casqa.org.**

3.2.2 Sediment Control BMPs

Sediment control is any practice that traps soil particles after they have been detached and moved by rain, flowing water, or wind. Sediment control measures are usually passive systems that rely on filtering or settling the particles. Sediment control, or capturing the sediment once it is mobilized, is considered back up or secondary to good erosion control.
Table 3 indicates the BMPs for sediment control that should be considered and included in SWPPPs by trade Subcontractors as applicable on the construction site.

Table 3. Construction Sediment Control BMPs

BMP Name
Silt Fence
Fiber Rolls
Gravel Bag Berm
Sand Bag Barrier
Storm Drain Inlet Protection
Stockpile Management

If additional information or instructions are needed for BMP installations, the CASQA website and Cutsheets can be found at: **www.casqa.org.**

3.2.3 Tracking Control BMPs

Tracking control consists of preventing or reducing the tracking of sediment off site by vehicles. Daily inspections will be conducted at the construction entrances and if track-out is observed, the area will be swept by the Trade Subcontractors. If additional information or instructions are needed for BMP installations, the CASQA website and cutsheets can be found at: **www.casqa.org.**

3.2.4 Wind Erosion Control BMPs

Wind Erosion Control is a very important BMP for the Project. All Trade Subcontractors are required to comply with the regulations specified by the local Air Quality Control District. Construction will be halted if required to do so due to high wind conditions as specified by the local Air Quality Control District, and/or common sense. Alternative forms of wind erosion control such as tackifiers and covers will be utilized as necessary to avoid and minimize windblown dust from leaving the project site. If additional information or instructions are needed for BMP installations, the CASQA website and cutsheets can be found at: **www.casqa.org.**

3.2.5 Non-Storm Water Control BMPs

Non-storm water management BMPs are source control BMPs that prevent pollution by limiting or reducing potential non-storm water pollutants at their source or eliminating offsite discharge. These practices involve day-to-day operations of the construction site and are also referred to as “good housekeeping practices” which involve keeping a clean, orderly construction site.

Non-storm water management BMPs includes procedures and practices designed to minimize or eliminate the discharge of pollutants from vehicle and equipment cleaning, saw cutting, pipe testing and other activities that generate liquid slurry or water based effluent. All storm/sanitary drain inlets should be located and protected during construction such that non-storm water carrying pollutants does not enter the inlets. Paving and concrete work should be undertaken during dry weather and drain inlets covered

during these activities. During wet weather construction, the drain inlets should be protected with a BMP that filters water such as sediment traps, silt bags and straw wattle.

3.2.6 Waste Management/Materials Control BMPs

Waste management and materials pollution control BMPs, like non-storm water management BMPs, are source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source before they come in contact with storm water.

These BMPs also involve day-to-day operations of the construction site, are under the control of the Trade Subcontractors, and are additional "good housekeeping practices" which involve keeping a clean, orderly construction site. Waste management consists of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project. The objective is to prevent the release of waste materials into storm water runoff or discharges through proper management of the following types of wastes:

- Solid
- Sanitary
- Concrete
- Hazardous
- Equipment – related wastes

Materials pollution control (also called materials handling) consists of implementing procedural and structural BMPs in the handling, storing, and the use of construction materials. The BMPs are intended to prevent the release of pollutants during storm water and non-storm water discharges. The objective is to prevent or reduce the opportunity for contamination of storm water runoff from construction materials by covering and/or providing secondary containment of storage areas, and by taking adequate precautions when handling materials. Material Safety Data Sheets, covered and secondary containment and employee training are important examples of materials pollution control. These controls must be implemented for all applicable activities, material usage, and site conditions by each Trade Subcontractor working on the Project.

The following BMP Table 4 indicates the BMPs for Trade Subcontractors to utilize to control construction site wastes and materials for the project.

Table 4. Waste Management and Material Handling Control BMPs

BMP Name
Material Delivery & Storage
Material Use
Spill Control
Solid Waste Management
Hazardous Materials/ Waste Management
Concrete Waste Management
Sanitary/Septic Waste Management
Liquid Waste Management

Fuel (gasoline/diesel), hydraulic oil, motor oil, and other liquid or hazardous waste materials used for vehicle and equipment maintenance may be used on the construction site and at the lay down areas if applicable permits are obtained and spill/response measures are adhered to. Minor amounts of lubricants and hydraulic fluid may be stored in vehicles. Spill response equipment will also be located onsite and near active construction.

Waste management BMPs includes procedures and practices designed to minimize or eliminate the discharge of pollutants from vehicle and equipment use, as well as fueling and maintenance operations to storm water drainage systems or to watercourses. Drip pans, diapers or alternative containment will be placed under equipment and vehicles (as applicable during maintenance or if leaking is suspected) while not in use, to catch and/or contain drips and leaks and prevent soil contamination. Construction crews will be educated to check parking areas visually for signs of leaking liquids; any vehicles found to be leaking onto the soil surface will be provided with temporary drip pans while at the project site. Fueling may be conducted on the job site and at the lay down area if fueling BMPs are implemented, appropriate permits are obtained and proper spill control policies and procedures are followed.

It is important that Trade Subcontractors minimize or abate the exposure of materials stored or spilled at the site. Spill Response Procedures for smaller spills are presented in BMPs. If a larger spill or discharge offsite occurs, or if the project receives a written notice or order from any regulatory agency, Trade Subcontractors will follow their Health & Safety Plan and Spill Prevention Countermeasure and Control Plan (SPCC) as well as comply with all Federal, State and local spill reporting regulations.

4 BMP INSPECTION, MAINTENANCE AND RECORD KEEPING

Inspection and maintenance of BMPs are an integral part of the Project and will be followed by the Trade Subcontractors. During visual inspections, if any BMP deficiencies or any storm water compliance issues are observed, the Trade Subcontractor's Construction Supervisor will be notified immediately and the deficiencies will corrected as soon as possible. The Trade Subcontractors are responsible for maintaining and/or submitting any required monitoring records as required by regulatory agencies in accordance with current regulatory guidelines.

Table 5. Trade Subcontractor Maintenance, Monitoring and Repair Procedures

PRACTICE	MONITORING, MAINTENANCE AND REPAIR PROCEDURES
Erosion Control	Check all soil protection including fabric, plastic, rock, hydroseed, mulch and velocity dissipation before, during and after rain events. Repair or replace as necessary to maintain proper function.
Street Cleaning	Streets must be periodically cleaned. Large quantities of soil tracked onto the street will be picked up by a loader bucket and/or hand shoveled back onto the pad. Streets must also be swept on an as-needed basis to maintain continuous sediment and litter control. Street washing shall not be done.
Sediment Control	Check integrity and functioning of berms, straw bales, check dams, and silt fences. Repair any eroded areas and remove accumulated debris.
Inlet Protection	Monitor installation and maintenance of sediment barriers and inlet protection devices. Check periodically during storms and repair or remove sediment as necessary to maintain appropriate functioning.
Temporary Basins	Remove accumulated sediment when sediment accumulates to within one foot of the outlet elevation and restore original dimensions of the basin. Obtain dewatering discharge permit from SFPUC prior to any dewatering of stored surface or groundwater.
Materials/ Equipment Storage	• Petroleum products shall be stored out of the rain and waste materials shall be stored in secured containers. Paints, solvents, enamels, sealers, bonding agents, and other chemicals shall be stored inside a covered, secure area. • Keep designated storage areas clean and well organized. Conduct weekly monitoring to check for damaged containers, leaks, etc. • Keep chemicals in original containers and keep them labeled. • Train employees and subcontractors on the use of the storage area.
Fueling Practices	• If refueling of equipment is conducted on site, make sure that

PRACTICE	MONITORING, MAINTENANCE AND REPAIR PROCEDURES
	fueling is occurring in designated areas and that secondary containment items such as drain pan or drop cloth are nearby to catch fuels/leaks. • Inspect and maintain vehicles and equipment regularly to minimize leaks and drips. • Comply with Federal, State and local requirements for fuel storage tanks.
Herbicide/ Pesticide Application	Provide the landscape contractor with knowledge about proper procedures for application of designated chemicals.
Waste Disposal	Provide proper disposal procedures for specific materials
Litter Control	Place trash bins in appropriate locations and are being used properly. Pets will not be allowed on the Project during construction.
Equipment Cleaning	If equipment cleaning is done on site, make sure contractors are using designated, bermed wash areas to prevent wash water from entering storm drain system.

5 LIST OF CONTRACTORS/SUBCONTRACTORS

The following is a partial list of Trade Subcontractors, suppliers and consultants that may be employed on the Project. Names and contact numbers for each activity on the list can be obtained from Webcor /Obayashi upon request. This list is to be updated as necessary. This plan can be utilized as part of a subcontractor notification letter to document Subcontractors notification of their obligation to uphold applicable storm water pollution control regulations.

TRADE	NAME	Signature Indicating Willingness To Provide, Maintain, and Implement SWPPP in compliance with all applicable City Ordinances and Codes
Architect		
Bricklayers		
Cabinet Makers		
Carpenters (finish)		
Carpenters (rough)		
Ceramic Tile Installers		
Civil Engineer		
Cleaning Crews

Waterproofing Subcontractors		
Window Installers		

6 INSTRUCTIONS TO FIELD PERSONNEL

Webcor /Obayashi will be responsible for mandating that SWPPP documents be prepared by Trade Subcontractors and also for observing the site on a regular basis in keeping with the standard of care for a General Contractor. Webcor /Obayashi will coordinate day to day oversight of the Project as a whole, track compliance with their contract obligations as well as Trade Subcontractor costs, direct Trade Subcontractors to maintain the Project site in accordance with all applicable regulations, and attend to discussions with the City regarding compliance concerns. Contracts with Trade Subcontractors and Sub tier Subcontractors shall include a requirement to comply with the provisions of this Plan and to maintain compliance with all applicable City Ordinances and Codes. The Trade Subcontractors, Sub tier Subcontractors and their Project Superintendents for this project are hereby authorized to uphold, certify, and maintain their own SWPPPs and to distribute it to all field personnel responsible for monitoring the site and maintaining compliance with storm water regulations. All subcontractors, field personnel and their assigns that work at the site must conform to the requirements described in this Plan and the SWPPP developed for Trade Subcontractor activities and any alterations thereof made at the time and in the manner herein specified, and in all respects according to its intent and meaning, and shall indemnify and hold harmless Webcor /Obayashi, its officers and agents, if failure to conform results in legal action or any other action by the Regional Water Quality Control Board or City. Duties of the Trade Subcontractors include but are not limited to:

- Maintaining full compliance with their SWPPP and all City Codes and Ordinances.
- To this effect, the Trade Subcontractors shall have authority to mobilize their own crews for:
    - BMP Installation, monitoring and maintenance.
    - Obtaining dewatering and other applicable permits necessary for the satisfactory completion of their contract.
    - Providing for elimination of all unauthorized discharges.
    - Coordinating with the City such that all updates, amendments, corrections and/or repairs are made in a timely fashion.
    - Stopping any construction activity that is in violation of municipal ordinances or codes or that is inconsistent with the provisions of the Trade Subcontractors SWPPP.

7 CLOSING

The Project will comply with the storm water discharge regulatory framework in the site vicinity through implementation of this Construction Stormwater Pollution Control/Compliance Plan. This Plan indicates that each Trade Subcontractor is responsible for preparing, submitting for approval, installing and maintaining a SWPPP with BMPs for protecting inlets to the SF combined sewer system from construction activities. BMPs included in the SWPPPs prepared by each Trade Subcontractor should include practices from the BMP categories outlined in this Plan. The SWPPP shall be implemented concurrently with the commencement of Trade Subcontractor construction activities and maintained by the Trade Subcontractor in a form that provides the Project with full compliance throughout the construction schedule for activities undertaken by the Trade Subcontractor. Though projects such as the subject Project that are serviced by the combined sewer system in San Francisco are not subject to the terms of the State Construction General Permit, Section A of the Construction General Permit describes in detail the requirements for a SWPPP, and the City and County San Francisco specifies that it should be used as a design guide. All construction sites must prevent illicit discharge into the SF combined sewer system.

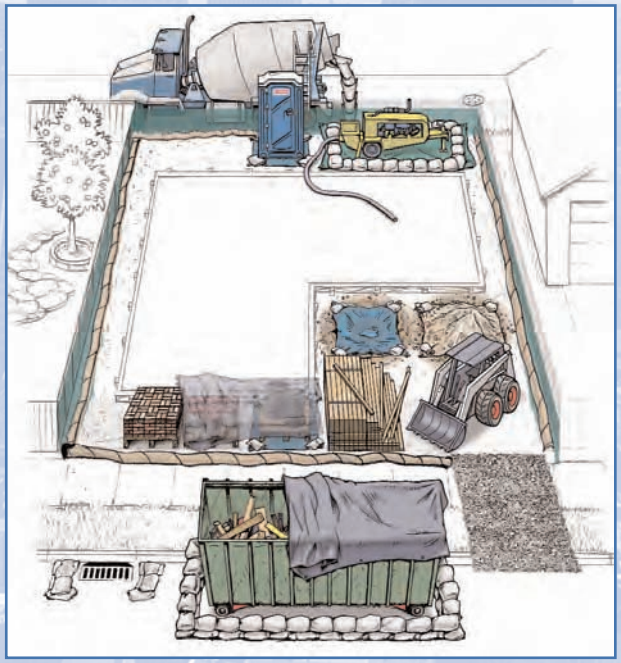
San Francisco CA, 94124

Keep it on Site

Pollution Prevention Guide

for the

Construction Industry



Keep it on Site

The San Francisco Public Utilities Commission (SFPUC) is pleased to announce **Keep it on Site**, as part is its new program to prevent water pollution at construction sites.

Runoff from construction sites is a major source of water pollution, and is subject to requirements such as the development of a stormwater pollution prevention plan, a plan review, stormwater treatment measures, runoff monitoring and increased site inspections.

As part of our Construction Site Water Pollution Prevention Program, this brochure will assist construction professionals understand and comply with the new State and Federal laws. Here, you will find valuable information on methods used on construction sites to keep pollution, such as dirt and construction site debris out of our sewage treatment system and sensitive local water bodies.

We hope to make your job easier while keeping our city clean by providing you with the information to create an efficient and environmentally safe construction site.

Together, we have the ability to preserve the quality of life in San Francisco.

Water Pollution Prevention Program

Water Pollution Prevention Program

The goal of the Water Pollution Program is to control pollution at its source in order to protect the Bay, ocean, creeks and lakes.

Emergency Phone Numbers

To report illegal dumping of hazardous materials or wastes to the storm drain or sewer system, call San Francisco Water Pollution Prevention Program hotline: (415) 695-2020

Hazardous Spills: 911

Inspection and Enforcement Program

The Construction Site Inspection and Enforcement Program was established to ensure that all businesses operate in compliance with all appropriate stormwater laws and other City requirements. Contractors, site supervisors and property owners can be held responsible for violations, which may lead to a civil penalty of up to $25,000 per day and reimbursing the City for all expenses associated with clean up[1].

Construction materials such as paint, dirt, and trash often find their way into our storm drains,

[1] *San Francisco Sewer Use Ordinance Article 4.1, Public Works Codes*

Best Management Practices

jeopardizing San Francisco's sewer system, and polluting surrounding local water bodies.

Contractors are now required to implement what are known as Best Management Practices (BMPs) on all construction sites. BMPs are methods used to keep pollution out of our storm drains and catch basins and off of City property such as sidewalks, streets, and alleys. Installing and maintaining these BMPs on the construction site is critical to protecting our sensitive water bodies.

If your project is greater than 1 acre, you are required to prepare a formal Stormwater Pollution Prevention Plan (SWPPP). Please contact SFPUC's Environmental Regulation and Management for more information at (415) 695-7310.

The following is a list of BMPs and pollution prevention measures that must be implemented at all construction sites.

- Identify all storm drains and catch basins near the construction site and ensure all workers are aware of their locations to prevent pollutants from entering them.
- Protect all storm drain and catch basin inlets.
- Develop an erosion control and sediment control plan for wind and rain.
- Develop spill response and containment procedures.
- Inspect site regularly to ensure that BMPs are intact.
- Conduct daily site cleanings as needed.
- Educate employees and subcontractors about BMPs.
- Regularly maintain all BMPs at project site.

BEST MANAGEMENT PRACTICES

Site Overview

This drawing illustrates Best Management Practices (BMPs) that must be followed at all construction sites in San Francisco.

Preserve existing vegetation

Preserving existing trees and vegetation where possible will prevent erosion.

Paint and Stucco

All paint and stucco materials stored on the site must be contained and covered. It is illegal for contractors to wash out paintbrushes in the street or dump any residues in the sewer or the storm drain. Paintbrushes and spray guns shall be washed/cleaned out into a hazardous materials barrel or put back into its original container and disposed of properly. Latex paint should be dried in its container and placed in the garbage. Oil paint and thinners need to be recycled as hazardous wastes.

Perimeter Controls

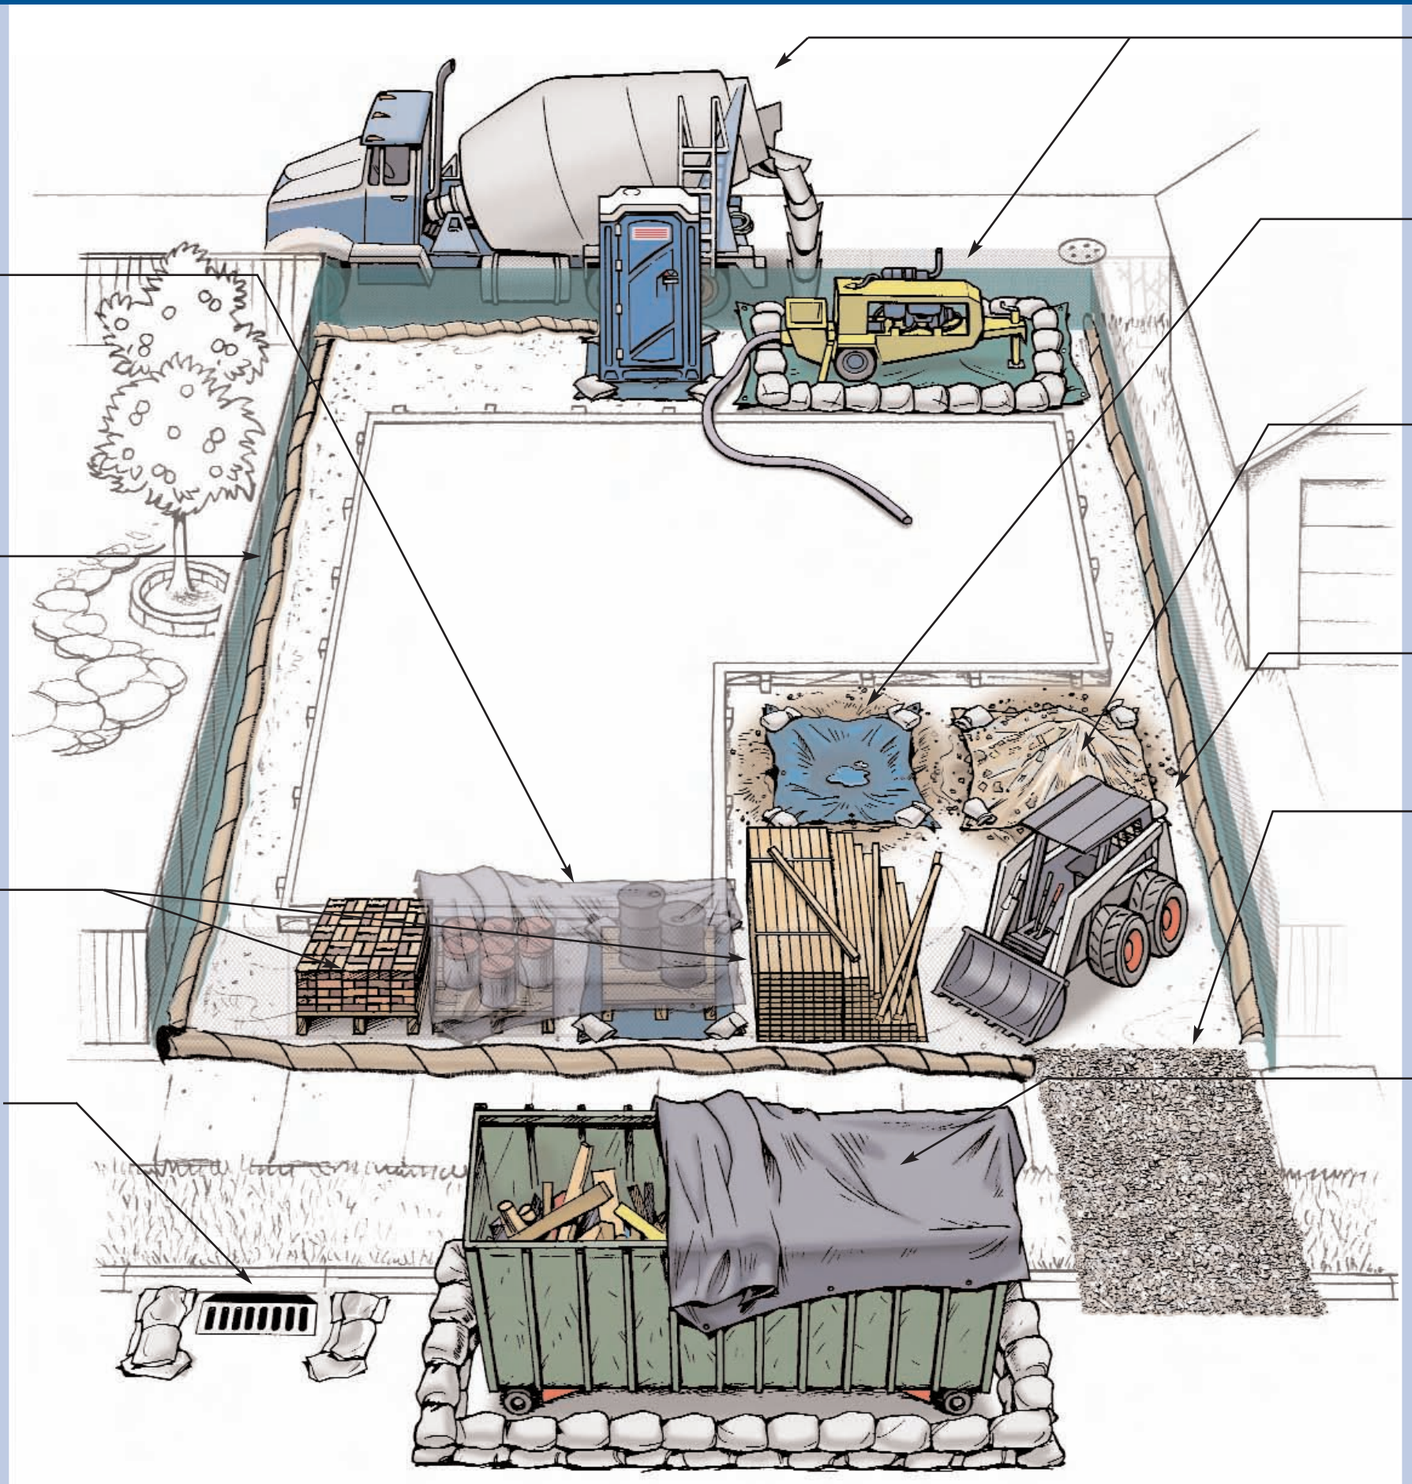
Gravel bags, silt fences, and fiber roles are acceptable perimeter controls, and shall be used to surround the entire site. Upstream perimeter controls prevent water from running into your site and down-stream controls prevent sediment from leaving your site. Avoid running over perimeter controls with vehicles or heavy equipment, as they can damage the materials. Replace any damaged perimeter controls immediately. Keep extra absorbent materials and/or a wet/dry vacuum on site to quickly pick up unintended spills. Sites must also be checked and maintained daily.

Building Materials / Staging areas

Construction materials must be stored onsite at all times. The only exception is if you have a right-way-permit. Building materials should always be covered when not in use to prevent runoff caused by wind or rain. To apply for a right-of-way permit, contact the Bureau of Streets Use and Mapping at (415) 554-5810.

Storm Drains and Catch Basins

Storm drains must be protected at all times with perimeter controls, such as fiber rolls or gravel bags.



Concrete Trucks / Pumpers

Any concrete pumpers parked in public streets or alleys must be surrounded by perimeter controls, such as berms, gravel bags or fiber rolls. Tarps also must be placed beneath concrete pumpers at all times. Residual materials must be cleaned up as well.

Washout Area

The disposal of "wet" construction materials should be handled in the washout area. This includes paint, stucco, and concrete. Use a gravel bag or fiber roll and tarp to collect evaporation and prevent run-off in nearby areas. The washout area must be checked and maintained daily to ensure compliance.

Dirt and Grading

Mounds of dirt or gravel should be stored on site and covered each day with a tarp. When in use, all exposed dirt piles should be sprayed with water to prevent excessive dust. Tarps must be available and onsite to cover 125% of exposed areas during the rainy season (October-April).

Earthmoving Equipment

All earthmoving equipment should be stored onsite. Maintenance and repair should never be conducted on the site. All tracks and trails left by equipment leading to and from the site should be cleaned up immediately.

Construction site stone or rock access drives

Stone or rock access drives at any construction site should be made of 3-4 inch fractured stone aggregate with a geo-textile liner below the grade of the road. This is to be used by all vehicles to limit tracks of mud onto the streets.

Dewatering Activities

A batch discharge permit is required before releasing any construction site wastewater. Call 415-695-7310 for more information.

Dumpsters

Keep dumpsters covered. Areas around dumpsters should be swept daily.

TRANSBAY TRANSIT CENTER

Hazardous Materials Management Plan

Revision 1

March 11, 2011

WEBCOR/OBAYASHI JOINT VENTURE
SAN FRANCISCO, CA

TABLE OF CONTENTS

Hazardous Materials Management Plan
TRANSBAY TRANSIT CENTER
San Francisco, California

Webcor/Obayashi Joint Venture will be responsible for mandating that Hazardous Materials Procedures documents shall be prepared by Trade Subcontractors and also for observing the Trans Bay Transit Center site on a regular basis in keeping with the standard of care for a General Contractor. Webcor/Obayashi Joint Venture will also coordinate the day to day oversight of the Project as a whole, compliance with their contract obligations, the tracking of Trade Subcontractor costs, directing Trade Subcontractors to maintain the Project site in accordance with all applicable regulations, and for discussions with the City regarding compliance concerns. Contracts with Trade Subcontractors and Sub tier Subcontractors shall include a requirement to comply with the provisions of this Plan and to maintain compliance with all applicable City Ordinances and Codes. The Trade Subcontractors, Sub tier Subcontractors and their Project Superintendents for this project are hereby authorized to uphold, certify, and maintain their own Hazardous Materials Procedures Plans and to distribute it to all field personnel responsible for monitoring the site and maintaining compliance with Federal State and local regulations. All subcontractors, field personnel and their assigns that work at the site must conform to the requirements described in this Hazardous Materials Procedures developed for Trade Subcontractor activities and any alterations thereof made at the time and in the manner herein specified, and in all respects according to its intent and meaning, and shall indemnify and hold harmless Webcor Builders-Obayashi, its officers and agents, if failure to conform results in legal action or any other action. Duties of the Trade Subcontractors include but are not limited to:

- Maintaining full compliance with their Hazardous Materials Procedures plan and all City Codes and Ordinances.
- To this effect, the Trade Subcontractors shall have authority to mobilize their own crews for: monitoring and maintenance.
- Obtaining dewatering and other applicable permits necessary for the satisfactory completion of their contract.
- Stopping any construction activity that is in violation of municipal ordinances or codes or that is inconsistent with the provisions of the Trade Subcontractors Hazardous Materials Procedures plan.

The Transbay existing Terminal Building has been demolished and replaced with a multimodal Transit Center that includes an underground rail station. The depth of the excavation will be approximately 65 feet. A soil-cement shoring wall extending approximately 120 feet below ground surface (bgs) will form the perimeter of the Transit Center. A concrete buttress will be placed under the Transit Center adjacent to 301 Mission Street extending down to bedrock, approximately 240 feet.

This HMMP includes the requirement to mitigate potential health and safety (H&S) risks to the environment, workers, and site-user associated with the presence of certain constituents in the soil at the Site.

ENVIRONMENTAL REPORTS

Webcor /Obayashi Joint Venture have reviewed environmental reports prepared for the site. The following is a summary of the previous reports:

Phase I Environmental Site Assessment

The eastern portion of the Site is located in an area historically known as the Tar Flat which was a former industrial area developed during the Gold Rush Era of the 1850's. The Site has been occupied by numerous buildings involved in metal work facilities, foundries, and a coal yard. Also, the San Francisco Gas Light Company was located on the south central and south eastern edge Site. Coal tar waste is believed to have been discharged into the surrounding tidelands which include the eastern portion of the Site. The Transbay Terminal Building was constructed between the years of 1936 ad 1938 and was used as a passenger rail station. In 1958, the train tracks were removed and/or paved over and the Site has been used by buses since. In the 1950's, elevated concrete roadways were built on the Site as part of the Transbay Terminal and the Embarcadero Freeway. The Embarcadero Freeway was damaged during the 1989 Loma Prieta earthquake and was subsequently demolished. Since the 1990's, the Site has remained largely unchanged.

Significant findings included:

- The subsurface fill material at the Site may contain elevated concentrations of heavy metals and other residual petroleum hydrocarbons. These concentrations are likely associated with the presence of 1906 earthquake fill material located below the ground surface. Special soil handling and/or sampling will likely be required during any construction activities.

- Due to the proximity of the former San Francisco Gas and Light Plant (bounded by First, Fremont, Howard, and Natoma Streets) and the presence of manufactured gas by-product waste found on nearby properties, hazardous materials may exist in the subsurface beneath the Site. Special soil handling and/or sampling will likely be required during any construction activity.

- The soil and groundwater near the West section of the Transbay Terminal Building may contain petroleum hydrocarbons and VOCs associated with the former USTs release. Special soil and groundwater handling and/or sampling will likely be required during any construction activities.

Site Investigations

Limited soil and groundwater sampling has been performed beneath the ramps and near the Transbay Terminal building in 1999 and 2008 by Treadwell & Rollo. Also, they performed an Environmental Site Characterization (ESC) in 2009 at the Transbay Terminal which included collecting soil samples of the fill material and underlying sand from 23 exploratory borings, chemical testing of selected samples, and evaluating the results. Treadwell & Rollo collected groundwater grab samples from four of the exploratory borings for chemical analysis. The objective of the ESC was to assess the presence of petroleum hydrocarbon and metal contamination in the soil and groundwater beneath the Site that will be removed and disposed during the proposed construction activities. Concentrations of chemical compounds and metals detected in the soil and groundwater samples were compared to state and federal criteria for hazardous waste and disposal options.

The results of our environmental site characterization and other available subsurface information in the vicinity indicate the Site is generally underlain by approximately 5 to 16 feet of fill material, composed of loose to medium dense silty sand with varying amounts of brick, wood, tar, and glass fragments. The presence of fill material underlying the Site is likely associated with the 1906 earthquake and fire. A sand layer consisting of medium dense to very dense sand with variable amounts of silt approximately 15 to 18 feet thick underlies the fill material. Bay Mud is present beneath the sand layer.

Soil Results

TPHg was detected above the method reporting limit (0.1 mg/kg) in 3 of the 88 samples analyzed at concentrations ranging from 0.29 mg/kg to 26 mg/kg. TPHd was detected above the method reporting limit (2 mg/kg) in 9 of the 87 samples analyzed at concentrations ranging from 2.01 mg/kg to 54.8 mg/kg. TPHmo was detected above the method reporting limit (4 mg/kg) in 49 of the 88 samples

analyzed at concentrations ranging from 4.09 mg/kg to 137 mg/kg. Methylene chloride was detected in 3 of the 14 samples analyzed at concentrations ranging from 0.056 mg/kg to 0.24 mg/kg. No other VOCs were detected at or above methods reporting limits.

Total cyanide was not detected above the method reporting limit (1 mg/kg) in any of the 5 samples analyzed. No SVOCs, Pesticides, PCBs, Sulfide, or Cyanide were detected at or above method reporting limits in the samples analyzed. The pH measured in five samples ranged from 6.70 standard units (S.U.) to 8.66 S.U.

Total lead was detected in each of the samples analyzed at concentrations ranging from 1.2 mg/kg to 1,000 mg/kg (Table 2). Total lead was detected at concentrations at or above 50 mg/kg but below 1,000 mg/kg in 33 soil samples. Each of these soil samples was subsequently run for STLC and TCLP lead to determine soluble lead levels. One soil sample (TR-21-5) matched the State of California hazardous waste criteria of 1,000 mg/kg for total lead and subsequently run for TCLP lead to determine if this soil represents a federal RCRA hazardous waste. The TCLP result was 0.83 milligrams per liter (mg/L) so less than the federal RCRA hazardous waste criteria of 5 mg/L.

STLC lead was detected at or above the method reporting limits in 33 of the 34 samples analyzed at concentrations ranging from 0.13 mg/L to 52.1 mg/L. A total of 19 soil samples exceeded the State of California hazardous waste criteria of 5 mg/L. TCLP lead was detected at or above the method reporting limits in 22 of the 36 samples analyzed at concentrations ranging from 0.13 milligrams per liter (mg/L) to 14.5 mg/L. A total of one soil sample (TR-21-5) exceeded the Federal hazardous waste criteria of 5 mg/L.

The remaining metal concentrations were within normal[1] background ranges found in the western United States with the exception of zinc in sample TR-2-1.5 which was detected at a concentration of 5,600 mg/kg.

Groundwater Results

No oil and grease, TRPH, or SVOCs were detected above method reporting limits in any of the four samples. TSS was detected in all the samples with concentrations ranging from 110 mg/L to 160,000 mg/L. COD was detected in TR-19-GW, TR-20-GW, and TR-24-GW with concentrations of 24 mg/L, 20

[1] "U.S.G.S. Professional Paper 1270, Element Concentrations in Soils and Other Surficial Materials of the Conterminous United States," 1984.

mg/L, and 64 mg/L, respectively. Phenolics were detected in TR-24-GW at a concentration of 0.074 mg/L. TR-19-GW, TR-20-GW, and TR-24-GW were tested for pH with concentrations of 7.41 S.U., 7.07 S.U., and 7.45 S.U., respectively.

Trichloroethylene was detected in TR-8-GW at a concentration of 1.58 mg/L. 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, benzene, ethylbenzene, isopropyl benzene, n-propybenzene, styrene, toluene, and total xylenes were detected in TR-19-GW with concentrations of 0.0223 mg/L, 0.00568 mg/L, 0.0251 mg/L, 0.011 mg/L, 0.00561 mg/L, 0.00138 mg/L, 0.00143 mg/L, 0.0171 mg/L, and 0.0591 mg/L, respectively. Methyl tert-butyl ether (MTBE) was detected in TR-20-GW at a concentration of 0.00078 mg/L. Naphthalene was detected in TR-19-GW, TR-20-GW, and TR-24-GW at concentrations of 0.417 mg/L, 0.00371 mg/L, and 0.0548 mg/L, respectively. No other VOCs were detected in any of the samples.

Antimony was detected in TR-20-GW at a concentration of 0.012 mg/L. Arsenic was detected in TR-24-GW at a concentration of 0.024 mg/L. Barium was detected in TR-8-GW, TR-19-GW, TR-20-GW, and TR-24-GW at concentrations of 0.066 mg/L, 0.052 mg/L, 0.085 mg/L, and 0.022 mg/L, respectively. Chromium was detected in TR-8-GW and TR-20-GW at concentrations of 0.032 mg/L and 0.008 mg/L, respectively. Cobalt was detected in TR-8-GW and TR-20-GW at concentrations of 0.011 mg/L and 0.006 mg/L, respectively. Molybdenum was detected in TR-8-GW, TR-20-GW, and TR-24-GW at concentrations of 0.01 mg/L, 0.024 mg/L, and 0.009 mg/L, respectively. Nickel was detected in TR-8-GW, TR-20-GW, and TR-24-GW at concentrations of 0.054 mg/L, 0.052 mg/L, and 0.013 mg/L, respectively. Vanadium was detected in TR-8-GW, TR-19-GW, TR-20-GW, and TR-24-GW at concentrations of 0.032 mg/L, 0.012 mg/L, 0.012 mg/L, and 0.021 mg/L, respectively. Zinc was detected in TR-8-GW, TR-20-GW, and TR-24-GW at concentrations of 1.1 mg/L, 0.013 mg/L, and 0.011 mg/L, respectively. No other metals were detected in any of the samples.

SUBSURFACE CONDITIONS

The results of previous site investigations and other available subsurface information in the vicinity indicate the Site is generally underlain by approximately 5 to 16 feet of fill material, composed of loose to medium dense silty sand with varying amounts of brick, wood, tar, and glass fragments. The presence of fill material underlying the Site is likely associated with the 1906 earthquake and fire. A sand layer consisting of medium dense to very dense sand with variable amounts of silt approximately 15 to 18 feet thick underlies the fill material. Bay Mud is present beneath the sand layer.

Groundwater was encountered at the time of the investigation at depths ranging from 13 to 20 feet bgs. Groundwater levels may fluctuate depending on the season. The groundwater flow direction is likely to the northeast towards San Francisco Bay.

DISCUSSION

Based on the analytical results from the Site subsurface investigation and previous analytical results, some of the fill material contains elevated total and soluble lead levels at concentrations exceeding Federal and State of California hazardous waste criteria. The remaining fill material will most likely be accepted at a regulated Class II and/or Class III landfill. Based on previous environmental investigations at the Site and vicinity, the sand underlying the fill would likely be disposed of as unrestricted waste.

The area of fill material containing soluble lead concentrations exceeding the Federal hazardous waste criteria are near boring TR-21 at a depth of 5 feet bgs. The areas of fill material containing total and soluble lead concentrations exceeding the State of California waste criteria are located near borings TR-1 at depths of 1.5 and 5 feet bgs, TR-2 at depths of 1.5, 3 and 5 feet bgs, TR-4 at depths of 3 and 5 feet bgs, TR-8 at depths of 1.5 and 3 feet bgs, TR-14 at a depth of 3 feet bgs, TR-15 at a depth of 3 feet bgs, TR-16 at a depth of 5 feet bgs and 10 bgs, TR-17 at depths of 1.5, 3 and 5 feet bgs, TR-19 at a depth of 7.5 feet bgs, TR-20 at a depth of 7.5 feet bgs, and TR-21 at a depth of 3 feet bgs. The remaining fill material will be disposed as Class II non-hazardous waste.

Groundwater is encountered at depths ranging from approximately 13 to 20 feet bgs across the Site. The proposed construction activities most likely will encounter groundwater in quantities that will require its removal from the subsurface. Prior to discharge into the sanitary sewer system, the dewatering contractor will obtain a batch groundwater discharge permit from the San Francisco Public Utilities Commission (SFPUC).

Because hazardous materials were detected at the Site, a SMP and a HASP will be required prior to construction. The Subcontractor HASP will outline proper soil handling procedures and H&S requirements to minimize worker and public exposure to hazardous materials during construction.

RECOMMENDATIONS FOR MITIGATIVE ACTIONS

The results of previous environmental investigations at and near the Site indicate the fill material beneath the Site contains elevated concentrations of heavy metals and petroleum hydrocarbons. The presence of these compounds poses soil management and potential H&S issues to be addressed as part of the Site

development activities. The soil management objectives for the Site are to minimize exposure to construction workers at the Site, nearby residents and/or pedestrians, and future users of the Site to constituents in the soil.

Health and Safety Issues

There may be a potential H&S risks associated with the heavy metals and petroleum hydrocarbons detected at the Site. There also may be a potential for this soil to affect construction workers at the Site, nearby residents and/or pedestrians, and future users of the Site. The routes of potential exposure to the petroleum hydrocarbons and metals could be through three pathways: 1) dermal (skin) contact with the soil, 2) inhalation of dusts, and 3) ingestion of the soil.

The most likely potential for human exposure to the petroleum hydrocarbons and metals in the soil will be during soil excavation operations. Because on-site materials contain concentrations of petroleum hydrocarbons and lead in excess of the Proposition 65 guidelines, there is a requirement that appropriate health and safety procedures, as well as warning requirements, be implemented during construction. The trade sub contractor will be responsible for establishing and maintaining proper H&S procedures to minimize worker and public exposure to Site contaminants during construction. Webcor/Obayashi Joint Venture will oversee this process and require the development and implementation of a comprehensive HASP, which should be prepared by a certified industrial hygienist that represents each subcontractor or its sub tier contractor.

The H&S training requirements, i.e. trained in accordance with Section 1910.120 of 29 Code of Federal Regulations (HazWoper training), specific personal hygiene, and monitoring equipment that will be used during construction to protect and verify the H&S of the construction workers and the general public from exposure to constituents in the soil. Air monitoring to evaluate the amount of airborne particles during excavation will be required by the tub trade contractors. All reports will be kept in a central location managed by Webcor/Obayashi Joint Venture.

A representative of Webcor/Obayashi Joint Venture and the Site health and safety officer (HASO) representing the trade subcontractor will be on site at all times during excavation activities to ensure that all health and safety measures are maintained. The Webcor/Obayashi Joint Venture representative or HASO will have authority to direct and stop (if necessary) all construction activities in order to ensure compliance with the HASP.

The purpose of the HASP is to provide field personnel with an understanding of the potential chemical and physical hazards, protection of any off-site receptors, procedures for entering the project Site, H&S procedures, and emergency response to hazards should they occur. All project personnel shall read and adhere to the procedures established in this HASP. A copy of all plans will be kept on site during field activities and will be reviewed and updated as necessary.

The general public will be protected through the following measures maintained by trade subcontractors and monitored by Webcor/Obayashi Joint Venture:

- the Site will be fenced;
- exposed soil at the construction Site will be watered as necessary to prevent visible dust from migrating off-site;
- soil stockpiles will be covered;
- water will be misted or sprayed during the loading of soil onto trucks for off haul;
- trucks transporting contaminated soil will be covered with a tarpaulin or other cover;
- the wheels of the trucks exiting the Site will be cleaned prior to entering public streets;
- public streets will be swept daily if soil is visible; and
- Excavation and loading activities will be suspended if winds exceed 20 miles per hour.

Soil Management

The proposed construction activities will disturb soil during the excavation activities including: soil handling during archeological investigations, shoring wall installation, construction of a buttress for the adjoining 301 Mission Street property, timber pile removal and disposal, utility relocation and the mass excavation for the new Transbay Transit Center. During all excavation activities, dust control measures will be implemented to reduce potential exposure. These measures shall include moisture-conditioning the soil using dust suppressants and covering the exposed soil and stockpiles with weighed down plastic sheeting to prevent exposure of the soil.

Since all the contaminated fill material will be excavated and disposed of off-site, there will be no risk of direct contact with the underlying fill material by future Site users.

The Site's HASP (prepared by the trade sub contractor) will contain additional dust monitoring, action levels, dust control measures, and work stoppage provisions that will be followed during construction activities.

Soil Segregation and Disposal

Before any excavation activities begin at the Site, a TJPA representative shall be provided documentation from the excavation contractor that the accepting landfill facility for the soil from Transbay Terminal project has been provided with and has reviewed all analytical data collected from the Site. TJPA shall approve all off-site disposal facilities and soil transportation contractors, including, without limitation, available insurable coverage, and prior to the shipment of any soil or other waste materials. The TJPA representative will provide testing and schedule the intervals that testing shall occur.

The results of previous soil analytical testing indicate that some of the soil located at the Site will be disposed off-site at a Class I landfill, however additional chemical testing of the soil may be required by the landfill prior to disposal. The excavation contractor shall be responsible for tracking the disposition of soil removed from the Site. Any excavated soil characterized as a hazardous waste shall be tracked using the Uniform Hazardous Waste Manifest System (USEPA Form 8700-22), as applicable. Soil not characterized as a hazardous waste shall be tracked using non-hazardous bills of ladings. All documentation will be provided to TJPA during the excavation activities.

If soil stockpiling of suspected contaminated soil is to be performed, the excavation contractor shall establish appropriate soil stockpile locations on the Site to properly segregate, cover, control dust, profile, and manage the excavated soil. Stockpiled soils are to be placed on top of one layer of 10-mil polyethylene sheeting (or equivalent), such as Visqueen. When stockpiled soil is not actively being handled, top sheeting will be adequately secured so that all surface areas are covered.

Soil Disposition

The Trade Sub contractor will establish appropriate off-site soil disposal locations and direct truck loading scheduling and/or soil stockpile locations on the Site to properly segregate, cover, moisture control, and profile the excavated soil. Soil profiling criteria will ultimately depend on the acceptance criteria of the landfills receiving the soil. These procedures will be established by the excavation contractor and coordinated with the proposed landfills prior to initiating soil excavation. It is not anticipated that soil will be reused at the Site for construction-related activities.

The Webcor Obayashi JV will, on behalf of TJPA, will be responsible for tracking final soil dispositions and turn that information to the TJPA representative. Any excavated soil considered hazardous waste will be tracked using the Uniform Hazardous Waste Manifest System (USEPA Form 8700-22), as applicable. Soil not considered hazardous waste will be tracked using non-hazardous bills of lading. These two systems will be used to comply with appropriate state and local requirements.

The contractor will arrange for transportation of all wastes off-site. Hazardous and non-hazardous waste will be transported to the appropriate disposal facility using a permitted, licensed, and insured transportation company. Transporters of hazardous waste must meet the requirements of 40 CFR 263 and 22 CCR 66263. All trucks transporting bulk hazardous waste will be properly lined and covered with compatible materials. Trucks will be decontaminated prior to any use other than hauling contaminated materials unless the contaminated material was already double-contained. The contractor will be responsible for preparing and submitting traffic control plans for trucks entering and leaving the Site. A decontamination pad location plan and decontamination procedures will be prepared. A route plan will also be prepared showing the expected route each truck will use to reach each landfill.

For soil that is to be exported off-site that is characterized as a hazardous waste, an appropriate USEPA Generator Identification Number will be recorded on the hazardous waste manifests used to document transport of hazardous waste off-site. The hazardous waste transporter, disposal facility, and U.S. Department of Transportation (DOT) waste description required for each manifest will be determined on a case-by-case basis. A description of the number of containers being shipped, the type of container, and the total quantity of waste being shipped will also be included on each manifest.

Webcor/Obayashi Joint Venture representative will be responsible for overseeing the sub trade provides accurate completion of the hazardous waste manifests and nonhazardous bills of lading. Records of all wastes shipped off-site will be maintained by TJPA and will be made available for inspection on request. The final destination of wastes transported off-site will be documented in the Site Closure Report that will be prepared by others.

Soil Sampling

If needed, chemical testing of the stockpiled soil will be performed to profile the soil for disposal. Soil profiling criteria depends on the proposed landfill location or off-site receiving facility. These procedures shall be established by the excavation contractor and coordinated with the proposed landfills prior to initiating soil excavation. Typical soil profiling requirements are one four-point composite sample per 500 to 750 cubic yards to be disposed.

If soil samples are required for analysis, the samples shall be collected by the TJPA representative and tracked.

Timber Pile Removal and Disposal

Part of the foundation system for the Transbay Terminal building includes timber piles beneath the basement slab. During the excavation activities these timber piles will be removed and disposed of. The timber piles will be extracted from the subsurface and as much as possible removal of all the soil which is attached to the timber pile will need to be performed. The extracted timber piles will be segregated, tested by the TJPA representative and transported. If disposed of as a Treated Wood at a Class II non-hazardous waste with copies of the Bill of Ladings will be submitted to TJPA representative.

Underground Storage Tank Removal and Disposal

If a underground storage tank (UST) and/or and associated product lines are found, arrange for a licensed tank removal contractor to properly remove and dispose of the UST. Proper permits and notifications should be in place prior to removing the UST. If soil staining is observed, place the affected soil into a stockpile onto plastic sheets and cover with plastic sheets. The Environmental Consultant will complete soil sampling and analysis tasks for UST closure in accordance with San Francisco Fire Department (SFFD) and SFDPH.

Coal Gasification Residual Material

The former San Francisco Gas Light Company was located on the south central and south eastern edge of the Site. Coal tar waste is believed to have been discharged into the surrounding tidelands which include the eastern portion of the Site. Excavation in this area of the Site will most likely encounter residual coal tar waste. Some of the coal gasification residual material encountered may be former piping, coal tar, phenols, heavy metals, and polynuclear aromatic hydrocarbons. If any coal gasification residual material is encountered during the excavation, the material will be stockpiled onto plastic sheeting and covered with plastic sheeting. The TJPA representative will collect soil samples and analyzed the material to determine proper disposal of the material.

Groundwater Management

Groundwater is encountered at depths ranging from approximately 13 to 20 feet bgs across the Site. The proposed construction activities most likely will encounter groundwater in quantities that will require its removal from the subsurface. Prior to discharge into the sanitary sewer system, the dewatering Trade Subcontractors will obtain a batch groundwater discharge permit from the San Francisco Public Utilities

Commission (SFPUC). Based on analytical results of the groundwater samples analyzed during previous Site investigations, approval of the groundwater discharge from the dewatering system would be granted by SFPUC.

Dust Control

Prior to initiating construction activities, a dust control plan (prepared by Trade Subcontractor and specific to this project) will be implemented to reduce potential exposure during excavation and loading operations. This document will contain measures to protect construction workers and the public including: dust monitoring, action levels, dust control measures, and work stoppage provisions that will be followed during construction activities.

Dust control will be accomplished through implementation of engineering controls, including light water spraying or misting of stockpiled soil, truck loading areas and work areas. Misting or spraying will be performed to sufficiently reduce fugitive dust emissions, but limited to prevent water runoff. Efforts will also be made to minimize the soil drop height from an excavator's bucket onto soil piles or into transport trucks. The site-specific dust control plan will as needed, include some or all of the following procedures: site fencing; wetting soil; analysis of wind direction; dust monitors at the work zone and at the Site perimeter and appropriate record keeping, visible inspection; establishing a hotline for community response; limiting excavation area; soil storage regulations (e.g. covering stockpiles); windbreaks; paving; truck loading requirements (e.g. covering vehicles or excavator bucket drop heights); Site vehicle speed limits; wheel washing; street sweeping; termination of excavation if winds exceed 20 mph; and/or addition of soil stabilizers; or other responses as needed.

Contingency Procedures

Hazardous materials including; sumps and/or vaults, asbestos piping, former monitoring wells, and soil with petroleum hydrocarbon odors and/or stains may be encountered during excavation activities. If unanticipated hazardous materials are encountered, the following procedures will be maintained by trade subcontractors and monitored by Webcor/Obayashi Joint Venture:

- stop work in the area where the suspect material was encountered and cover it with plastic sheets;
- notify the Webcor/Obayashi Joint Venture representative, the TJPA Environmental Consultant for Site a inspection and appropriate action in the suspect area; and
- review the existing H&S plan and make revisions, if necessary; and

- Have appropriately trained personnel on Site to work with the affected materials, once directed by Webcor/Obayashi Joint Venture.

If a sump and/or vaults are encountered during excavation activities, contact the TJPA Environmental Consultant for inspection and appropriate action. If no liquid, obvious staining or odors are observed, sump and/or vaults will likely be destroyed and disposed of. If liquid is present within the sump and/or vault and/or obvious staining and odors are observed, the TJPA, Environmental Consultant will collect samples for analyses to determine how to properly disposal of the material.

If stained soil or odors are observed, plastic sheeting will be placed over the affected area and the TJPA Environmental Consultant will be contacted for inspection and appropriate action. If the material is to be excavated, the material will be stockpiled onto plastic sheeting and covered with plastic sheeting. Soil samples will be collected and analyzed to determine proper disposal of the material.

REQUEST:

Please clarify the designer's intent:

Sheet Sl-2303 indicates that the south end of Transfer Girder TR9 extends beyond the B87 and B88 beams southern edge and partially into the intersecting MFBl beam which is angular to the B87 beam. Section 8/S 1-3701 indicates that there are welded rebar couplers at the top flange of the TR9 girder to match the B78 beam reinforcing, but the B78 beam ends at the B87/B88 intersection prior to the southern end of the TR9 girder.

Co-Author:

REQUEST:

Bracing removal sequence on the East end of Zone 4
WOJV is proposing the following sequence for the bracing removal for the east side of Zone 4.
See sketch SK1, attached.

Sequence
1. Remove level D struts and walers from within the green clouded area up to GL- 32.2 once the mat slab beneath has reached adequate strength.
2. Remove level D struts within the Blue clouded area STD-65 to 74, 82 & 83 and all corresponding walers once the mat slab beneath has reached adequate strength, the sequence for de-stressing will be the diagonals struts should be all de-stressing prior to the 4 remaining cross lot struts (STD-65,66,67 & 68).

For the remaining levels A, B and C WOJV is proposing to follow a similar removal sequence as Level D

Please confirm if this sequence would be acceptable.

0010	BRP - Number of Barrette Pile Tremies	Void	09/18/2014	09/28/2014		Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:**

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Contract drawing S-3191 indicates two openings (for two tremies) in each Barrette's rebar cage. This drawing is in conflict with Contract Specification 31 63 32 3.4 D 3 that indicates that three tremies are needed for each Barrette (one tremie for each 7 feet of wall length). Please note that the Response to RFI-0050 allowed for the length of the barrette piles to be increased from 20'-0" to 21 '-0".

The European Standard EN 1538 indicates two tremies (properly spaced so that the concrete does not have to travel more than 8 feet) is sufficient for each Barrette. Additionally, in reference to RFI BRP-0055 and, in an effort to reduce rebar congestion, 2 tremies are preferred.

Please confirm that two tremie pipes per Barrette are acceptable.

1205.1	BGP - Lower Concourse Blockouts to Pour Train Level Partition Walls	Closed	03/22/2014	04/01/2014	04/09/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author: Transbay Joint Powers Authority Sylvia Wong

REQUEST:

Please see attached drawing for the general layout of Lower Concourse blockouts taking into account the response to RFI T-1205.
Due to limited site access to the Train Level once the Lower Concourse is poured, the partition walls will have to be poured in 2 lifts, except for the tank walls which will be poured monolithically. In the case where a blockout coincides with features above or below (ie beam below or future partition wall above) the blockout will be offset and the train level partition wall be poured using the "Bird's Mouth" method (see Detail 3 on attached drawings). To ensure consolidation in differing height wall pours, SCCI will install top bulkheads on walls with lower heights due to overhead beams. SCCI will maintain minimum separation gap between the top of partition wall and Lower Concourse elements as detailed. The blockouts will be installed with styrofoam per Detail 4 in the attached drawings, prior to the Lower Concourse being poured. The blackouts will have a keyway on each side with top and bottom rebar disecting the blockouts per Details 1 and 2 in the attached drawings. Once the partition walls have been poured, the blockouts will be poured back with the same grout that will be used to pour back the trestle pile blockouts.
Please confirm this is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Where the RFI states that walls will be poured in "two lifts", this is interpreted to mean "two phases". Blockouts shall be poured back with concrete or product approved through the submittal process. Coordinate layouts and phasing plan with comments noted on Submittal TG0600-907.0 BGP - Construction Joint Layout - Partition Walls Area 3 and 4. RFI is confirmed in other regards.

B-0001	BRP - Project Alignment Coordinates	Closed	05/29/2014	06/08/2014	06/05/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

Note 58 on Contract Drawing C-0005 gives a project start location of Alignment BBTT as 1722.28 feet at bearing S67°27'2 l "E from DPW Survey Control Point No. 54. Though the entire BBTT alignment could be calculated from this information, there would be no check tie at the end of the alignment and significant errors could result. Shimmick Construction Company Inc. (SCCI) requests that the coordinates of the begin curve (BC) and end curve (EC) be supplied to supplement the given curve data. Additionally, SCCI requests that the coordinates for the BC and EC locations for the curves of all alignments be supplied.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The distance and bearing from DPW Control Point No. 54 to Station 29+88.82 is 403.97 feet at N16°26'45"W. Contractor to verify.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
B-0001.1	BRP - Project Alignment Coordinates	Closed	06/16/2014	06/26/2014	06/20/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

SCCI has received the response to RFI #0001 which provided a way to determine coordinates of the end of the "BBTT" alignment. However, no begin of curve (BC) or end of curve (EC) coordinates were given as requested. In order to properly lay out the alignments, SCCI will have to rely on CAD drawings provided in Transmittal No. 150-00268 from Jon Valencia (PMPC). SCCI would like to confirm that the CAD drawings provided in this transmittal are warranted to be used for construction.

Please confirm.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Coordinates of the begin and end of curves (BC and EC) can be calculated with the alignment data presented in the drawing. The distance and bearing to and from the survey control points can be used for checking the alignment layout.

REQUEST:

The elevation view of the bents on sheet S-3100 show 5 weakened plane joints at the base of the columns. These can be seen in further detail from sheet S-3102, details H and 1. SCCI proposes that these weakened joints be removed so that bents match the condition of the existing Fremont street offramp bents.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is not acceptable. The weakened plane joints are required.

B-0006	BRP - Utility Demolition Plan - Tehama Street	Closed	06/11/2014	06/21/2014	06/23/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** AECOM Technical Service Tsu Ling Peng

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

Sheet U-1005 shows utility demolition work in the area surrounding Clementina Street, and Sheet U- 1006 shows utility demolition work in the area surrounding Howard Street. There is no sheet showing any utility demolition work (or lack thereof) in the area surrounding Tehama Street (between Clementina and Howard). Please provide plan sheet showing utility demolition work surrounding Tehama Street.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

There is no existing utility demolition work proposed surrounding Tehama St, hence no demo drawing for this area is included in the set. Note - The proposed Bus Ramp is overhead crossing the Tehama St. The proposed footing and foundation construction do not impact the existing utilities and Tehama St. curb & gutter.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
B-0006.1	BRP - Utility Demolition Plan - Tehama Street	Closed	06/25/2014	07/05/2014	07/18/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** AECOM Technical Service Tsu Ling Peng

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

In response to "RFI B-0006 BRP-Response-Utility Demolition Plan - Tehama Street", Shimmick requests a utility demolition/relocation plan for Tehama Street be provided (between Sheets U-1005 and U-1006). There is an existing CCSF Street Light in the path of the proposed new bus ramp, as well as an overhead utility line (Comcast fiber optic) and associated poles (PG&E) which will interfere with the proposed bus ramp construction. Please confirm CCSF streetlight and Comcast fiber optic line and poles on Tehama to be moved by others.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Contractor shall coordinate and relocate the existing above-ground and underground utilities impacted by the proposed bus ramp construction through the TJPA Representative.

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

Follow-Up To RFI B-0002 ERP-RESPONSE- Hazardous and Contaminated Materials Location:

RFI B-0002 ERP-RESPONSE- Hazardous and Contaminated Materials Location listed "Transbay Transit Center Program
Limited Phase II Soil and Groundwater Investigation Report Transbay Terminal West Loop Bus Ramps and Future Transit Center Site East of Beale St." (ERM-West, December 2008) and "Transbay Program Site Management Plan Addendum Transbay Transit Center Bus Ramps" (Treadwell & Rollo, February 2013) as the basis of bid item estimates for bid items 40, 41, and 42.

These documents do not provide for specific quantities and locations of Class I (Bid Item 40), Class II (Bid Item 41) and Federal RCRA (Bid Item 42) contaminated materials on site.

Please provide a detailed map and/or plan indicating the locations of Class I, Class II, and Federal RCRA contaminated materials similar to the site plan sheets titled "Site Plan With Boring Locations and Map Extents" (Figures 2-7, Treadwell & Rollo) and provided in Spec 0 I 13 50/ AP A - Site Mitigation Plan of the project documents (provided as an attachment to this RFI).

Please confirm that all contaminated soils identification, testing, and analytics shall be provided by the TJPA and/or the
prime contractor.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Please see attached Treadwell & Rollo memo "Preliminary Estimate of Volume of Fill Material" dated 4.25.13. This document served as the basis for assumed material off-haul quantities included in the Bus Ramps bid form.

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

In Figure 1 of "Site Plan of Preliminary Limits of State of California Class I Non-RCRA and Class II Non-Hazardous Fill Material", provided by Treadwell Rollo, the locations of the Class I and Class II materials are labeled incorrectly.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

See attached corrected site plan.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

The data provided in "Transbay Transit Center Program Limited Phase II Soil and Groundwater Investigation Report Transbay Terminal West Loop Bus Ramps and Future Transit Center Site East of Beale St." (ERM-West, December 2008), "Transbay Program Site Management Plan Addendum Transbay Transit Center Bus Ramps" (Treadwell & Rollo, February 2013) and per our meeting on 6/20/14, indicate that the Class I material was found in borings SB-04
through SB-09 as well as S-3 through S-5. These borings are identified as Class II material on the map provided. Borings SB-10 through SB-12 and S-1 /2 contained Class II material. It appears the colors in the legend are reversed. Please provide map with a revised legend.

B-0007.3 **BRP - Hazardous Materials Location Follow Up** **Closed** **07/22/2014** **08/01/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:**

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

Per RFI-0007.2 Response, a map of locations of Class I and Class II contaminated soils located on the Bus Ramps site was provided by Treadwell & Rollo for use by SCCI. During the meeting held 6/20/2014 at the Webcor Offices to discuss the hazardous materials on site and development of a hazardous materials location map, it was indicated that there would be no federal RCRA material encountered on the site and that Class I and Class II contamination depths would vary between I' and 2' below grade.

During waste profiling with our disposal site, SCCI has encountered the following discrepancies:

Per the T &R map, the area around sample SB-05 should be Class I material. Per the soil test analytics provided in the Bus Ramps Site Mitigation Plan and the ERM-West Phase II Soils Report, samples SB- 5-3 and SB-5-6 test over the Class I limit for Lead and Barium, respectively. Without the STLC (Soluble Threshold Limit Concentration) and TCLP (Toxicity Characteristic Leaching Procedure)

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Peter Cusak 8/12/14:

As requested, additional samples were taken at deeper depths and tested including STLC and TCLP. The test results show soils locations and depths below 2' are Class II and as Class I Non-RCRA (See attached map dated 8/5/14).

Based on the recent samples taken at various location mentioned in the tables 1 & 2, and recent analytical report (copies attached), the results confirmed presence of Class I & Class II contaminations, and no Federal RCRA material encountered on site (map provided)

The abovementioned information is consistent with the Bid documents.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

test results to confirm otherwise, material with these TTLC (Total Threshold Limit Concentration) results would have to be classified and disposed of as a federal RCRA material which is in conflict with the direction provided by the T &R map and the 6/20 meeting discussion.

Per the T&R map and meeting discussion, areas approximately north of Folsom Street would be contaminated with Class I material to a depth of 2' below grade, and areas approximately south of Folsom Street would be contaminated with Class II material to a depth of l' below grade. A small portion of the area east of the Sterling substation would be contaminated with Class I material to a depth of 1 '. Per the soil test analytics provided in the Bus Ramps Site Mitigation Plan and the ERM-West Phase II Soils Report, samples SB-5-3 and SB-5-6 are both potentially contaminated to a Class I or federal RCRA classification level at depths below 2', which is in conflict with the direction provided by the T &R map and the 6/20 meeting discussion.

The following is a list of possible soil samples provided which may be in conflict with the T &R map and 6/20 meeting discussion direction and may require additional testing to confirm soil classification:

SB-4-3 Need STLC and TCLP for Lead
SB-4-28 Need STLC for Chromium
SB-5-3 Need STLC and TCLP For Lead
SB-5-6 Need STLC and TCLP for Barium
SB-7-3 Need STLC and TCLP for Lead
SB-7-5 Need STLC for Chromium, Need STLC for Copper, Need STLC and TCLP for Lead
SB-8-3 Need STLC and TCLP for Lead
SB-8-21 Need STLC for Chromium
SB-9-3 Need STLC for Chromium, Need STLC and TCLP for Lead
SB-9-6 Need STLC for Chromium, Need STLC for Nickel
SB-10-12.5 Need STLC for Chromium

Please advise on discrepancies and additional test results and provide additional detail on location and depth of contamination on the site map.

Also, all soil samples begin at 3' or greater depth below

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

grade - please advise how contamination classification was determined for 1-2' depths below grade as the landfill will not accept the information as currently provided.

B-0008 **BRP - Bus Ramp to Transit Center Elevation Confirmation** **Closed** **06/12/2014** **06/22/2014** **06/18/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author:

REQUEST:

Reference attached Contract Documents.

Elevation discrepancy's exist between the Transbay Transit Center drawings and the Bus Ramp Bridge drawings, see below.

TTC building drawing
A1-2502: 57' - 11 1/4" (57.938') [HP of Bus Deck Level]
A1-6102: 57' - 10" (57.833') [Bus Deck Level]

Bus Ramp drawing
S-2063: 56' - 1 3/16" (56.10') ["BBTT" STA 29+04.81 FB]
C-2202: 57' - 11 3/4 (57.98') [Calculated at STA 29+04.81 per vertical curve information)

Please confirm which elevation governs.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The elevation discrepancy within the Bus Ramp drawings (Sheets S-2063 and C-2202) shall be governed by the elevation shown on C-2202.

The elevation discrepance within the TTC Building drawings (Sheets A1-2502 and A1-6102) shall be addressed by the Architect.

The elevation discrepancy between the Bus Ramp drawings and the TTC Building drawing appears to be citing elevations from different locations. BBTT STA 29+04.81 does not

appear to coincide with the location of the 57'-11 1/4" elevation along the TTC Building bus deck. The elevations cited for this discrepency should be checked.

B-0009	BRP - Exist Bent 20 Demolition	Closed	06/18/2014	06/18/2014	06/25/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

As shown in Contract Drawing D-1005, the entire existing Bent 20 foundation is to be removed. However, USA North ticket #219688 located two ATT duct banks 3' away from, and running parallel to, the property line on the south sidewalk of Clementina St. This utility is not shown on the Contract Drawings. The utility is located directly on top of the Bent 20 foundation as shown on the attached sketch.

Per SCCI's understanding, the reason to remove Bent 20 is to facilitate the installation of CIDH B4-3 and the drainage system shown on Contract Drawings U-1005 and C-4102. Shimmick proposes to remove the Bent 20 foundation only to the extent needed to enable the installation of CIDH B4-3 and the drainage system (the catch basin and sewer manhole will still be protected and supported in place). The extent of demolition should end roughly 4'-8" north of the CIDH pile to allow sufficient room for shoring yet not intrude on the utility. See attached drawing for proposed limits of demolition. Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

SCCI's proposal is acceptable.

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

On contract drawing S-6066 "Girder Layout- Frame No. 3", the sum of the dimensions for girders 3A through 3F is 51 '-0" while the plans scale to 52'-0". It appears that the error is in the dimension "3 EQ Spaces = 29'-0"" which is dimensioned as 29' -0", but scales to 30' -0". Please advise.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

On contract drawing S-6066 "Girder Layout- Frame No. 3", the "3 EQ Spaces = 29'-0" should be read as "3 EQ Spaces = 30'-0".

B-0012	**BRP - Requirements for Shoring Design**	**Closed**	**06/26/2014**	**07/06/2014**	**07/02/2014**	**Potentially**	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

Section 1.6H1 of Contract Specification Section 02 41 06 - Selective Site Demolition - Bus Ramps states that the "removal plan shall be prepared, wet-signed, and stamped by an engineer who is registered as a Structural Engineer in the State of California". This specification also applies to the design of temporary shoring for use in the demolition of existing foundations.

Per California Business and Professions Code, licensed Professional Civil Engineers may design structures except for public schools and hospitals. Therefore, SCCI proposes to allow the design of temporary shoring for demolition of existing foundations to be prepared, wet-signed and stamped by a licensed Professional Civil Engineer deemed by SCCI to have the qualifications and experience necessary for this work.

Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

SCCi's proposal to allow the design of temporay shoring for demolition of existing foundations by a licensed Professional Civil Engineer deemed qualified by SCCI to have the qualifications and experience necessary for this work would be acceptable.

B-0018	BRP - Bottom of Existing Footing Elevations	Closed	07/17/2014	07/27/2014	07/24/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

SCCI bid and planned the shoring necessary for demolition of the existing footings per the response to Question TG18.1-037 of IFB Questions & Answers TG18.1 Set #3 which included the statement that the bents north of Folsom Street were similar to Section P on Contract Drawing D-1106. This section shows a footing that is immediately below existing grade and is eight feet thick.

Additionally, SCCI reviewed the reference documents to confirm the bottom of footing elevations for these footings. Supplemental Drawing Nos. 7A and 8A of the San Francisco-Oakland Bay Bridge Railway Facilities drawings show the elevations of the bottom of footings. The first note on the Supplemental Drawing No. F-112 of the SFO Bay Bridge Railway Facilities drawings states to subtract 11 . 71' from these elevations to correct them to the city datum. SCCI has done this and compiled these elevations below.

This RFI will use the Bent 5 footing for example to show why SCCI does not believe that this is the correct datum correction to use. Section P on Contract Drawing D-1106 shows the Bent 5 footing immediately below grade and eight feet thick with a bottom of footing elevation of 53'-8". As shown in the table above, the elevation shown for this bottom of footing elevation on Supplemental Drawing 8A and correcting it to the city datum would provide an elevation of 29.29'. The same issue is easily seen using the section views on Bent 2 and 3 on the same Contract

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Arup does not have any more information than the Contractor has. We could not find a datum correction on the 1937 Contract R2 drawings, only on the 1939 Contract R3 drawings. For the purpose of proceeding with the work, we recommend that the contractor apply the datum correction from the Contract R3 drawings to the Contract R2 drawings and determine the existing foundation elevations based on this. Note the datum correction on Contract R3 drawing F-112 is from San Francisco-Oakland Bay Bridge Datum to City Datum. Refer to the survey drawings prepared by Martin M. Ron (specifically sheet 1 of 10) in the Contract Documents for the datum correction from NAVD88 to City datum.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Drawing.

Please confirm that the Datum Correction shown on Supplemental Drawing F-112 does not apply to Supplemental Drawings 7 A and 8A and provide the correct datum correction if necessary.

B-0019 **BRP - Selective Demolition of Foundations for CIDH Piles** **Closed** **07/17/2014** **07/27/2014** **07/24/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

On July 11, SCCI performed potholing for the existing foundations to be demolished and discovered that the depths of these foundations are significantly deeper than expected due to contradictory information provided in the responses to Bidder Questions and Reference Documents at bid time. The results of the potholing has allowed SCCI to eliminate certain information from these documents and is now proceeding under the assumption that the elevations provided in the San Francisco-Oakland Bay Bridge Railway Facilities and SFO Bay Bridge Railway Facilities are correct. These drawings indicate that these foundations are at depths as great as 34.5' from grade. SCCI requested that these elevations be confirmed in RFI B-0018 - Bottom of Existing Footing Elevations, submitted July 14.

The foundations to be removed are located adjacent to major San Francisco thoroughfares and buildings of up to ten stories. SCCI believes that large excavations next to these structures could potentially undermine these streets and the foundations of these buildings. SCCI also believes that it is possible to reduce the number of these large excavations by reducing the volume of concrete to be removed from these foundations.

SCCI has reviewed Contract Drawings D 1000 through D 1106 and has determined that the existing foundations Bent 5, 7 and 11 need only to be partially removed to facilitate the installation of CIDH piles. Additionally, SCCI

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable. The extent of existing footing to be removed shall equal the radius of the CIDH plus 1'-0" plus the maximum allowed tolerance (alignment and verticality) for the CIDH installation. Following removal, the excavation shall be backfilled and compacted in accordance with the requirements in Specification Section 31 00 06.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

is in receipt of Bus Ramps Change Order Request B-002 in which foundations similar to those in the base contract and in the same Bus Ramp alignment are only demolished to depths of five feet below grade.

Therefore, SCCI proposes to demolish Bents 5, 7 and 11 to a depth of five feet below grade and, below that, only to the extent necessary to allow for CIDH installation. Please see the attached drawing for reference.

Is this acceptable?

SCCI has received the responses to RFI #B-0019 and RFI #B-0019 .1 which allow for limited and selective demolition of existing foundations 5, 7, 9, 11 and 16. SCCI proposes to also perform selective demolition of existing foundation 17 in the same method proposed in these previous RFI's. SCCI would demolish Bent 17 to a depth of five feet and, below that, only to the extent necessary to allow for CIDH installation (footprint of CIDH plus one foot plus allowable tolerance on all sides) and the installation of the Bent 8 Pile Cap (Bottom of Footing Elevation 12.29').

Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable

B-0020	BRP - Building Foundations at Pylon 9	Closed	07/17/2014	07/27/2014	07/24/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

Contract Drawing D-1006 has a callout pointed at the Pylon 9 foundation that states "Remove existing building foundation and basement slab to place new foundation". SCCI found drawings in the Reference Document Transbay Transit Center Program Existing Terminal & Ramps Demo Plans - REVISIONS that show that the foundations under 564 Howard and 568 Howard, the buildings with foundation conflicts with Pylon 9, had been removed in a previous contract. SCCI, therefore, engineered and planned the work as if these foundations did not exist.

This reference drawing set also shows that the Bent 17 foundation on the south side of Howard was also removed in this same previous contract. Recent potholing for this foundation has led SCCI to believe that this foundation has not been removed. If the Bent 17 foundation was not removed, it is possible that building foundations in conflict with Pylon 9 may also not have been removed.

Please confirm that the foundations of 564 Howard and 568 Howard have been removed per the Reference Drawings.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

It is Arup's understanding that the drawings attached to the RFI which show the extent of demolition of 564 Howard and 568 Howard are correct.

B-0021	BRP - Surcharge Loading for Pylon 9 Equipment	Closed	07/18/2014	07/18/2014	07/24/2014	Potentially	☐

From: Webcor Construction LP Stephanie Azzolino **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Filip Filipic

REQUEST:

Based on discussion in Tuesday's (7/15/2014) meeting (Movement Review Committee), the following heavy equipment is required to install the barrettes at the Pylon 9 foundation:
1. 'Manitowoc 888 crawler crane: Maximum total load when holding full length barrette rebar cage = 705± kips. As shown on Figure 1, the crane will be set back a minimum of about 40' clear from the back of the TTC shoring wall when it is working. The "footprint" of the crane (defined as a rectangle with a length equal to the bearing length of the tracks and a width equal to the outto-out track dimension) is 24.6'x23.2', which has a total area of 571 sqft. The average vertical surcharge load acting over the machine footprint is 705,000/571 = 1235 psf.

2. Bauer MC128 Foundation Crane with a BC40 Trench Cutter (Hydromill): Maximum total load when working = 540± kips (includes pull force when retrieving mill from trench). As shown on Figure 2, the hydromill will be set back a minimum of about 13' from the back side of the TTC shoring wall when it is working. The "footprint" of the hydromill is 23.0/x20.5' = 472 sqft. The average vertical surcharge load acting over the machine footprint is 540,000/472 = 1144 psf.

3. Liebherr HS855HD crawler crane with clam. Maximum total load when working = 260± kips. As shown on Figure 3, the clam will be set back a minimum of about 10' from the back side of the TTC shoring wall when it is working. The "footprint" of the clam is 17.6'/x16.2' = 285 sqft. The average vertical surcharge load acting over the machine footprint is 260,000/285 = 912 psf.

Please confirm whether the TTC shoring system is capable of resisting the surcharge identified above.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is a Contractor's means and methods issue. The Contractor shall provide estimates for additional horizontal loading on the internal bracing system for evaluation by the TG06 trade subcontractor. This shall include a horizontal pressure diagram which can be added to the plots shown on TG06 drawing GT-1110 and additional kips per linear foot of wall values which can be added to Table 1 and Table 2 on TG06 drawing GT-1110.

REQUEST:

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

As discussed in Tuesday's (7/15/2014) Movement Review Commitee, please confirm whether the TTC shoring system is capable of resisting the surcharge loads from the following equipment walking off the trestle to the east of the Pylon 9:

1. Manitowoc 888 crawler crane: Maximum total load when walking off trestle = 565± kips. The "footprint" of the crane (defined as a rectangle with a length equal to the bearing length of the tracks and a width equal to the out-to-out track dimension) is 24.6'x23.2', which has a total area of 571 sqft. The average vertical surcharge load acting over the machine footprint is 565,000/571 = 990 psf.

2. Bauer MC128 Foundation Crane with a BC40 Trench Cutter (Hydromill): Maximum total load when walking off trestle = 460± kips. The "footprint" of the hydromill is 23.0/x20.5' = 472 sqft. The average vertical surcharge load acting over the machine footprint is 460,000/472 = 976 psf.

3. Liebherr HS855HD crawler crane with clam. Maximum total load when walking off trestle = 240± kips. The "footprint" of the clam is 17.6'/x16.2' = 285 sqft. The average vertical surcharge load acting over the machine footprint is 240,000/285 = 842 psf.

This is a Contractor's means and methods issue. The Contractor shall provide estimates for additional horizontal loading on the internal bracing system for evaluation by the TG06 trade subcontractor. This shall include a horizontal pressure diagram which can be added to the plots shown on TG06 drawing GT-1110 and additional kips per linear foot of wall values which can be added to Table 1 and Table 2 on TG06 drawing GT-1110.

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

SCCI has found a conflict between demolition drawing D-1005 and specification section 011570 3.2G.

According to drawing D-1005, existing Bent 22 extends underneath the entire south Clementina sidewalk width and 3' into the street. The shoring required to remove this footing along with the water barriers will extend another 5' into the street totaling to 8' intrusion into the street. The street is 18' wide at this bent location leaving a 10' for vehicle traffic as noted in approved traffic control plan 002 (TG 1801-036.1).

Specification section 011570 3.2G requires a 5' pedestrian walkway on the north and south side of Clementina. This is not possible due to the demolition of Bent 22 described above. SCCI proposes to keep the sidewalk on the south side of Clementina closed during demolition and re-open it to pedestrians once the footing and shoring has been removed.

Please confirm this is acceptable.

According to drawing D-1005, existing Bent 22 is not demolished and is to remain - please resubmit RFI with correct information.

If the Contractor is referring to drawing D-1005 Bent 20 which does have a portion of the demolition beneath the Clementina Street south sidewalk, there is no conflict.

If the Contractor determines that a section of the sidewalk must be closed for any reason, obtain STP from SFMTA before closing sidewalk.

For example; even with an approved Traffic Control Plan, to close the sidewalk requires an approved STP Special Traffic Permit. If during potholing and investigative work or during construction activity you wish to close the sidewalk, it is the expectation of the City and specification section 01 15 70, 3.2G that pedestrians have the use of the sidewalk at all times when construction is not in progress.

As was discussed last week in the field, there are options such that the sidewalk can be re-opened at end of shift or peds diverted into a sidewalk using part of Clementina Street if necessary.

B-0030 **BRP - Construction of Pylon 9 and Link Beam** **Closed** **07/28/2014** **08/07/2014** **07/29/2014** **Potentially** ☐

B-0031	**BRP - Harrison and Folsom Falsework Design**	**Closed**	**07/30/2014**	**08/09/2014**	**07/30/2014**	**Potentially**	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

SCCI has received the rejection of Traffic Control Plan numbers 007 (Folsom) and 008 (Harrison) and has attempted to design the falsework to span the entire width of the roads. Upon review by SCCI and VAK Construction Engineering Services, this design does not comply with the project specifications.

Please see our concerns with spanning the full length below:
- In order to cross Harrison without a center falsework support, our required span is 79'-6". Per specification section 03 11 14 1.7-A4, the maximum allowable falsework span is 60'-9".

-In order to cross Folsom without a center falsework support, our required span is 76'-8". Per specification section 03 11 14 1.7-A4, the maximum allowable falsework span is 50'.

- The minimum possible depth of the falsework is 3'6" (36" beam + 4x4s + plywood). The vertical clearance would be 14'-2" which is under the required 15' clearance.

- Reference VAK's memo and Folsom Falsework Schematics attached

Due to these design issues, SCCI proposes to use traffic islands to give the falsework a center support. This will divert traffic into the parking and maintain the same number of open lanes as shown in Traffic Control Plans 007 and 008. Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

WOJV to confirm the spans that are reported in the RFI as they are considerably longer than those listed in the August 10, 2012 memo from Sandis to WOJV.

Please provide all dimensions including sidewalks and parking lanes which may be able to be used for Falsework.

B-0032	**BRP - Barrette Acceptance Criteria**	**Closed**	**07/30/2014**	**08/09/2014**	**08/01/2014**	**Potentially**	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

Please see attached Memo from Bencor, SCCI¿s Barrette subcontractor. In light of the recent issues they have encountered at a nearby project with similar design and specifications and the fact that we only have two production barrettes, restricting us having test barrettes, SCCI asks the following questions:

1. Can the drill core verification process be substituted for the Crosshole Sonic Logging as the post installation acceptance criteria?

2. If not, please provide actual acceptance criteria for the Crosshole Sonic Logging. 31 63 32 does not provide any criteria for what defines a rejected pile. The specification only references ASTM 06760, which SCCI understands only provides how to do the test and provide results, but not acceptance criteria.

3. Can the #6 cross-tie rebar spacing be opened up? Possibly even increasing the rebar size, as remediation for the increased spacing.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 31 63 32 1.7 A requires the Contractor to submit qualifications for the contractor / subcontractors performing the barrette foundation work. Arup has not yet received this.

In response to the questions listed in the RFI:

1. No. Specification Section 31 63 32 1.8 D 1 a states "Crosshole sonic logging will be used to test the concrete density of the pile for homogeneity."

2. The test results will be reviewed for anomalies. An anomaly will be indicated by the CSL test if the first arrival time increases significantly, or if the energy reduces significantly, relative to a moving baseline. The evaluation of the test results will include the location, extent and quantity of anomalies. Acceptance or rejection of a pile will be based on the evaluation of the CSL test results, pile construction reports (see Specification Section 31 63 32 1.5 E), the results of additional testing if deemed necessary by the TJPA (see Specification Section 31 63 32 1.8 D 4) and any other information or observations which indicate conformance / nonconformance of the installed work with the Contract Documents.

3. The Contractor may propose alternate reinforcing steel arrangements for review. The capacity of the reinforced concrete section shall be the same as or greater than that shown on the Drawings and each longitudinal bar along the long faces of the pile shall be confined with a stirrup or tie as shown on the Drawings.

Arup will not comment on the July 29, 2014 Bencor memo attached to the RFI. This is internal correspondence between SCCI and their subcontractor. The Contractor's requests for interpretation or clarification of the Contract Documents are the three questions listed on the Webcor Obayashi Joint Venture letterhead.

Arup has not yet received the Comprehensive Construction Work Plan required by Specification Section 31 63 32 1.5 D.

B-0033 **BRP - Discrepancy in Location of Pylon 9** **Closed** **08/05/2014** **08/15/2014** **08/07/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Shimmick Construction (SCCI) has verified the BBTT alignment per the beginning bearing and distance from the contract drawings, and the End bearing and distance per RFI B-001. The pylon center at Pylon 9 is listed per the alignment stations of BBTT & TTBB on S-2261. SCCI has noted a discrepancy in this position of .16 feet between the alignment position of the pylon and the center position of the pylon as shown in CAD drawing S-2261. SCCI has checked/verified the BBTT alignment positions of other CIDH centers as shown on the CAD S-2261 drawing. SCC realizes that CAD drawings are not for record, but this may indicate a possible issue of the pylon location. SCCI also noted that the pylon centerline coordinate on S-6079 (Cable stay drawing) is different from these values. Supporting documents are attached.

Please confirm the center coordinate for the bent 9 pylon.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

See attached SK-S-0004 for the correct location of the pylon. Drawing S-6079 will be revised and issued in a forthcoming ASI.

B-0034 **BRP - Folsom Falsework Vertical Clearance** **Closed** **08/06/2014** **08/16/2014** **08/14/2014** **Potentially** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Note 4 on Contract Drawing D-1006 states:

"De-tension and remove existing tiebacks which interfere with construction of the pylon foundation. Do not de-tension the tiebacks until the TTC mat slab in Zone 1 has been placed and has reached its 28 day strength."

The mat slab in Zone 1 has been placed and has reached its 28 day design strength.

SCCI submitted Submittal TG 1801-208.1 Selective Site Demolition - Pylon 9 Temporary Shoring which included the memo De-tensioning of Existing Tiebacks at TTC South CDSM Wall for Pylon 9 Foundation Construction. This memo provided a procedure for de-tensioning these tiebacks. The response to this submittal stated that the tiebacks were to be de-tensioned and removed one at a time and that "instrumentation placed at the adjacent TTC excavation shall be reviewed for movements".

In response to the submittal comments received, SCCI plans to establish a baseline survey of the CDSM wall at the tieback locations and to monitor these benchmarks after each tieback is de-tensioned. All surveying/monitoring will be done with a Total Station. If no movement is detected at the time of monitoring, SCCI will proceed with de-tensioning of the next tieback. Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Arup has no issue with the plan proposed by SCCI in RFI B-0037 as Arup commented in the Submittal TG1801-208.1 Selective Site Demolition - Pylon 9 Temporary Shoring.

In response to WOJV/SCCI email dated 8/18/14 (attached) Arup has no issue with the plan proposed:

The proposed baseline survey of the CDSM wall at the tieback locations with "all surveying/monitoring will be done [by Shimmick] with a Total Station".

The de-tensioning and cutting of the first two (2) of the tie backs, at the end of the first day shift, and monitoring [by Shimmick] during the next day using the benchmarks with a Total Station.

The proposed "If no movement is detected at the time of monitoring", SCCI will proceed with de-tensioning of the next (3) tiebacks at the end of the second day's shift. This "will allow a cold cycle" prior to de-tension the remaining (3) tiebacks.

It is assumed that WOJV and the Internal Bracing contractor will continue monitoring movement as per contract. If movement is detected at the time of monitoring, and MRP meeting will be held to determine next steps in accord with contract.

B-0038	BRP - Removal of Pylon 9 Soldier Piles	Closed	08/14/2014	08/24/2014	08/20/2014	Potentially	☐

From: Webcor Construction LP Claude Titche

To: Turner Construction Company Phil Militello

Answered By: Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Submittal TG 1801 -208. I - Selective Site Demolition - Pylon 9 Temporary Shoring detailed the procedure for the installation and removal of the beam and plate shoring system at Pylon 9. Step 15 of the Construction Sequence on Sheet SH-I stated that the final step would be to "extract" soldier piles. One of the comments received on

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is not acceptable. The soldier piles may not be removed by pulling.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

this submittal was that the soldier piles "may not be removed by pulling as this will reduce the strength of the soil and its ability to resist later load-resisting capacity of the soil at the top of the barrettes". SCCI plans to remove these piles using a vibratory hammer as this will increase consolidation of the soil as the pile is removed.

Is this acceptable?

B-0039 **BRP - Removal of Unexpected Structure in Lot G** **Closed** **08/14/2014** **08/24/2014** **08/14/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Webcor Construction LP Claude Titche

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

While excavating around existing Bents 16 and Bent 17 in Lot G, SCCI encountered an unexpected structure comprised of concrete and brick at a depth of approximately six feet. The extent and dimensions of this structure have yet to be detennined. SCCI has determined that this structure will conflict with the Bent 8 pile cap to be constructed as well as the shoring system to be used for the demolition of existing Bent 16 and 17 and the construction of new Bent 8.

Please advise on how to proceed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

B-0040	BRP - Existing Column Foundation Removal for CIDH C1	Closed	08/15/2014	08/25/2014	09/03/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Contract Drawing D-1005 calls for the removal of an existing column foundation at the location of new CIDH C1. The detail on this drawing shows a column coming up from a spread footing. Therefore, SCCI expected this bottom of this spread footing to be at a reasonable depth similar to other foundation to be removed. No as-builts of this footing have been provided. Potholing performed by SCCI on August 14 determined that no spread footing exists within 40 feet from grade. Without additional drawings or information about this footing, SCCI believes it is possible that this foundation is actually a CIDH installed in a retrofit contract.

If this foundation is indeed a CIDH pile and extends as deep as to bedrock, its removal would be both cost and time intensive if it is possible at all. As shown on the attached picture, the edge of CIDH C1 is in conflict with the existing foundation at grade. This condition will prevent the installation of CIDH C1. Possible solutions include decreasing the diameter of the CIDH or moving the CIDH and column away from the existing foundation.

Please advise on how to proceed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Demolish the existing CIDH to an elevation of +14.00 (NAVD88). The location of column C1 will shift to clear the remaining portion of the existing CIDH. This will be issued in an upcoming ASI.

B-0042	BRP - Existing Bent 16 Retrofit Anchor Tiedown Length	Closed	08/19/2014	08/29/2014	09/03/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Contract Drawing D-1005 calls for the existing Bent 16 foundation to be removed to allow for the installation of the new Bent 8 CIDH piles and pile cap. The response to RFI B-0019.1 Selective Demolition - Additional Foundations stated that it was acceptable to demolish the Bent 16 foundation one foot plus the maximum tolerance outside of the CIDH footprint.

After reviewing the Reference Drawings Seismic Retrofit No. 14B, TT Ramps, SCCI has determined that CIDH B8-3 is in direct conflict with one of the anchor tiedowns installed at the Bent 16 retrofit as shown on the attached drawing. Sheet 23 of this Reference Drawing set shows the minimum unbonded length of this anchor tiedown to be 20 feet but does not specify the bonded length. SCCI needs to know the bonded length used for this tiedown to determine the appropriate removal method.

Please provide complete as-builts of this retrofit that show the total depth of these anchor tiedowns.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

See enclosed Requested Tie-Back As-Built.

B-0043	BRP - CIDH Permanent Casing	Closed	08/21/2014	08/31/2014	08/27/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

SCCI proposes to use corrugated metal pipe (CMP) as permanent steel casing for the CIDHs when using the optional construction joint, is this acceptable? The specifications are confusing on this subject.

Per Specification Section 31 63 30 3.5-B, " ... The permanent casing must:" then in section 3.5-B-5 " ... must comply with article 3.3." Per 31 63 30 3.3-C,"Temporary casings must be:" then in section 3.3- C-2; "noncorrugated with smooth surfaces." Since we are discussing a permanent casing and this section applies to temporary casings, does the noncorrugated rule apply?

Project Specification 31 63 30 appears to be based on the Caltrans Standard Specification. Using the 2010 version of

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The use of corrugated metal pipe (CMP) as permanent steel casing for the CIDHs when using the optional construction joint is acceptable provided the following:

- The casing complies with Specification Section 31 63 30 3.5-B. In regard to paragraph 5 in Section 31 63 30 3.5-B, casings placed in a drilled hole must comply with Caltrans Standard Specifications section 49-3.02C(5) "Permanent Steel Casing Installation".

- Contractor submits for record stamped calculations demonstrating that the CMP is capable of withstanding loads from installation, lateral concrete pressures and earth pressures, and will support personnel working

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

the CTSS, 49-3.02C(6)-5 is similar to the project specification 31 63 30 3.5, except it refers the "must comply" to a section on "Permanent Steel Casing Installation" {49-3.02C(5)}. As SCCI's Project Specification does not include a section on permanent steel casing materials, SCCI believes the reference to the Temporary Steel Casing to be inadvertent.

If safety and/or quality is a concern, SCCI can provide stamped engineering to stating that the CMP is capable of withstanding loads from installation, lateral concrete pressures and earth pressures and will support personnel working inside the casing after the CIDH installation is complete.

inside the casing after the CIDH installation is complete.

- The Contractor includes a description of the optional construction joint and the use of CMP in the Pile Installation Plan re-submittal. Include the name of a Caltrans project where CMP was used, and the name and contact information of the engineer or resident engineer.

Note: the Drawings specify permanent casing for the CIDH piers at the Fremont Off Ramp. Arup's acceptance of using CMP pertains to the bents at Frames 1 through 3 only at this time. Contractor to include a description of the work specific to the Fremont Street Off Ramp in the Pile Installation Plan re-submittal for Arup to evaluate. The description shall include the type of casing proposed for use, diameter, depth, etc.

B-0048	BRP - Changes to Barrette Pile Slurry Parameters	Closed	09/08/2014	09/18/2014	09/09/2014	Potentially	☐

From: Webcor Construction LP Stephanie Azzolino **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Part 2.4.A of Specification Section 31 63 31 - Barrette Piles - Bus Ramps provides the design criteria for the sodium bentonite slurry to be used at the Pylon 9 barrette piles. Based on their experience and their knowledge of constructability, SCCI's barrette pile subcontractor, Nicholson Construction Company (NCC), would like to propose the following changes.

1. 2.4.A.4.b.1 and 2: A mix of water and bentonite at the minimum 5.5% per unit weight of water produces a slurry density of 65 pounds per cubic foot (62.4 pcf + 0.055 x (bulk density of bentonite around 50 pct)= 65 pcf). A 3.5 - 4% per unit weight of water is required in order to produce an initial slurry density of 64 pounds per cubic foot as required in §2.4 A 4. Please confirm that a mix of water and bentonite at the minimum 4% per unit weight of water is acceptable.

2. 2.4.A.4.c.3: The maximum fluid loss, by filter press, is the same for in-trench as it is for initial slurry. This is not attainable in field conditions as the slurry fluid loss increases as the slurry is being reused. The widely utilized European standard (EN 1538) specifies the maximum fluid loss values of 50 cc (for in-trench slurry) and 30 cc (for initial slurry). As these are more attainable values based on experience, please confirm 50 cc (for in-trench slurry) and 30 cc (for initial slurry) is acceptable.

3. A significant part of the Barrettes will be excavated in clay and, when mixed with the bentonite slurry, the viscosity will increase. If the initial and in-trench slurry viscosity minimum is 40 seconds as specified, there is very little tolerance available on the slurry viscosity before it causes excess stress on the desanding pumps. The widely utilized European standard (EN 1538) specifies 32 seconds as a recommended minimum. Please confirm 32 seconds is acceptable as a minimum for slurry viscosity.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The changes proposed by the Contractor are acceptable provided all of the slurry test requirements and acceptance criteria, not just those listed in the RFI, follow Tables 1 and 2 from EN 1538.

B-0049	BRP - Barrette Pile Slurry Retention	Closed	09/08/2014	09/18/2014	09/09/2014	Potentially	☐

From: Webcor Construction LP Stephanie Azzolino **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REQUEST:

Slump retention requirements specified in the Contract Specifications 31 63 32 § 1.8 C 4 indicate a minimum slump of 7" after "duration of the pour" + 2 hours. The anticipated pour duration for each Barrette is 8-10h leading to a slump retention of l0-12h. Such slump retention is difficult to control which may delay setting time (well above l2h) and increases risks of excessive bleed and segregation. Based on experience, Nicholson and its concrete supplier recommend 6-8h of slump retention.

Please confirm min. 7" slump 6-8h after batch time is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable.

Note: The title of the RFI was incorrectly changed from SCCI's original RFI. The title of the RFI should be Barrette Pile Slump Retention.

B-0050 **BRP - Length of Barrette Piles** **Closed** **09/08/2014** **09/18/2014** **09/09/2014** **Potentially** ☐

From: Webcor Construction LP Stephanie Azzolino **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Contract Drawing S-3191 indicates a Barrette pile length of 20 feet. The standard construction method to build the barrettes involves two full primary bites being dug first followed by a middle bite in between the previously dug primary bites. With a Barrette measuring 20 feet in length, the middle bite will only be 1.6' in length. Such small middle bite may collapse on itself while digging a primary bite which could affect the verticality of that primary bite. Nicholson proposes to increase the length of the Barrettes to 21' to decrease the chance of the middle bite to collapse.

Please confirm Barrettes 21 feet in length is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable provided there is no additional cost to the TJPA.

B-0051	BRP - Intumescent For Frame 5	Closed	09/08/2014	09/18/2014	09/11/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

SCCI is actively pricing and re-designing the frame 5, drop-in span as part of CR B-005 and needs to better understand the original design intent for this bridge section as it relates to the intumescent paint.

1. The only drawings SCCI see reference to intumescent are S-5068, S-6111 Detail B, S-6112 Detail D, S-6113 Detail H and K, and S-6114 Detail N. Per these it appears the design intent is to install intumescent on the underside of the "tub" (S-5068), the additional "Tub" piece (N/S-6114), and all of the exposed steel on the frame 4 side, except the lowest horizontal steel (B/S-6111 and C/S6-112). At the building side, it is confusing as only H/S-6113 shows intumescent similar to the frame 5 side. K/S-6113 only shows the intumescent on the bottom of the restraining rod steel box. J/S-6113 and L/S-6114 do not show intumescent. Also of note, the steel link beam on details D and B of S-6115 do not show intumescent. Please confirm design intent of intumescent coverage.

2. Per specification 09 96 46 Intumescent Paint ¿ Bus Ramps, SCCI is to "provide the specified fire resistance classification approved by Authorities having Jurisdiction" Who are the authorities having jurisdiction? What is the fire resistance classification for frame 5? SCCI assumed during bid time and currently a 1- hour rating.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The response to this question contains Sensitive Security Information and is available only to individuals who have been granted access to the document that is the basis for the question.

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Section A and B of Contract Drawings S-3191 call for 6" concrete cover around the reinforcing cage in the barrette piles. Per Nicholson Construction Company's experience, given the rebar congestion of the reinforcement cage, the 6" concrete cover allows for a path of least resistance for the concrete to rise faster on the outside of the cage and increase the risks of having bentonite being trapped inside the cage during the concreteting operation. Nicholson believes that reducing the concrete cover to 3" will decrease the risk of this happening. SCCI's proposal will not change the width of the barrette pile, it will increase the width of the rebar cage by 6". Please note that the response to RFI B-0050 allowed for the barrette pile to be on foot longer in length. These changes will be shown on the shop drawings, to be submitted in a forthcoming submittal.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Arup does not believe that the 6" clearance will allow for a path of least resistance for the concrete to rise faster on the outside of the cage and, therefore, increase the risk of bentonite being trapped inside the cage during the concreteting operation as posited in the RFI. The rate of placement of concrete, i.e., the velocity, is very low at the perimeter. If anything, fresh concrete tends to flow around the tremie annulus. However, if SCCI believes that reducing the clearance will reduce the risk of defects, then Arup takes no exception to reducing the clearance to 4¿ provided there is no additional cost to the TJPA.

Is this acceptable?

Number	*Subject*	*Status*	*Date Created*	*Date Required*	*Date Answered*	*Cost Impact*	*Proceed*
B-0055	**BRP - Barrette Pile Reinforcement Cage**	**Closed**	**09/15/2014**	**09/25/2014**	**09/25/2014**	**Potentially**	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Contract Drawing S-3191 details the reinforcement needed for the Barrettes. The current reinforcement details indicate a clear space between rebar as low as 3.75" in some areas. Per Nicholson's experience and several codes (such as EN 1534 and US FHW A), a larger clear space is recommended as small clear spaces may impede the flow of concrete inside the cage and increase the risks of concrete anomalies.

As a result, Nicholson proposes to increase the bar sizes and use anchor heads (in lieu of hooks) in order to increase the clear space between rebar. Please see attached sketches SD-02 and SD-03. Note that the section of steel remains similar in any direction in order to avoid impacting the structural capacity of the Barrette.

Furthermore, due to space constraints at the site the cage will be built in two (2) 1 Oft wide by three (3) 60ft long sections approximately (the length will vary depending on the reinforcement requirement by elevation). Each 10ft x 60ft section will be prefabricated and transported to the site. Two 1 Oft sections will be joined together to form a 20ft section. Our sketches include the required horizontal reinforcement to join the sections. The three 20ft by 60ft sections will be lifted and installed in the trench.

Please confirm the reinforcement cage proposed is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

SCCI¿s proposed reinforcement layout included with this RFI is not acceptable as it does not satisfy the requirements of AASHTO LRFD Bridge Design Specifications, Fourth Edition (2007) with 2008 Interim Revisions which is the governing Code for this project as noted on drawing S-0005. According to AASHTO 5.10.6.3, #11 bars shall be tied at a maximum 6" o.c.. The proposed layout shows spacing of the ties as 10.5¿ and 5¿-0¿ o.c. .

Additionally, the horizontal bars which link the two cages, as proposed by SCCI, must have hooks to develop their capacity to make them effective in resisting the applied load.

The clear spacing between reinforcement is measured and codified along a distance normal to the length of the bar, not at hooks and not at two bars crossing perpendicular to each other, which is presumably where the quoted distance of 3.75" is measured. The clear spacing between bars in the reinforcement layout on Contract Drawing S-3191 is as follows:

Horizontal distance between ties: 8.9"

Vertical distance between ties: 5.4"

Horizontal distance between longitudinal bars: 6.4"

SCCI's proposed layout included with the RFI increases the horizontal clearances by only 0.48 inches.

The reinforcement layout on Contract Drawing S-3191 satisfies the requirements of EN-1538 (we believe the standard quoted in the RFI, EN 1534, is incorrect as this standard pertains to parquet flooring) which is a reference document, not a Code that applies to this project.

Arup has worked with the Nicholson, SCCI¿s subcontractor, in recent days to develop alternates to their proposal which satisfy the Code, which provide the same structural capacity as the layout shown on Contract Drawing S-3191, and which increase the

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

clear spacing in the cage. The attached sketch by Nicholson, received today, is acceptable provided there is no additional cost to the TJPA or there is a credit to the TJPA as the quantity of reinforcement is slightly less and there are fewer bars to handle.

Arup takes no exception to the SCCI¿s proposal to use headed bars instead of standard hooks at the top of the longitudinal bars. SCCI shall refer to Specification Section 03 20 56 for project requirements when using headed bars. However, the implied reasoning for the substitution, that the hooks cause congestion and impede the flow of concrete, is spurious as these hooks are located outside the barrettes.

B-0056 **BRP - Stay Cable Strand Size** **Closed** **09/15/2014** **09/25/2014** **09/18/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

SCCI has received the following RFI from VStrutural LLC (VSL):

"The contract documents for the Transbay Transit Center Bus Ramp project (ASI 150-003) specify that the steel strand for the stay cables be 0.6" diameter, 270 ksi, weldless low-relaxation seven-wire strand with fy=0.9fs, conforming to the requirements of ASTM A416. The majority of VSL's recent and ongoing stay cable projects have used or are using strand with the same overall properties, but with a slightly larger diameter of 0.62". Some of the projects using the 0.62" diameter strand include:

St. Croix River Crossing project in Stillwater, Minnesota (ongoing)
Tappan Zee Bridge Replacement project in Tarrytown, New York (ongoing)
Gerald Desmond Bridge Replacement project in Long Beach, California (ongoing)

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable provided that the 0.62" diameter strand is tested in accordance with the project specifications and that there is no additional cost to the TJPA.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Ironton-Russell Bridge project in Ironton, Ohio (ongoing)
Audubon Bridge project in St. Francisville, Louisiana (recent)
A25 Bridge project near Montreal, Quebec, Canada (recent)

In addition to being more widely utilized on recent stay cable projects than its 0.6" diameter counterpart, the 0.62" diameter strand has a slightly larger cross-sectional steel area (0.2325 sq in vs. 0.217 sq in for the 0.6" diameter strand). Using the larger individual strand steel area allows for the overall steel area in a particular stay cable to be achieved using fewer strands. Using fewer strands in a stay cable allows for extra unused holes in the cable anchorages, which allows for future expansion of load capacity within the stay. VSL's stay cable anchorages are designed to use either 0.6" or 0.62" diameter strand.

To illustrate the principle described above on the Transbay project, the currently project parameters specify that VSL's 109-strand anchorages be utilized with 109 EA, 0.6" diameter strands. In this configuration, the anchorages are completely filled with strand and thus cannot allow for future expansion of load capacity within the stays. The total required steel area for each cable is: 0.217 sq in x 109 = 23 .653 sq in. By using 0.62" diameter strands, the strand count for each anchorage could be reduced to 102 EA (0.2325 sq in x 102 = 23.715 sq in > 23.653 sq in). Using 102 EA strands in each cable leaves seven open holes in each anchorage, allowing for a significant expansion of load capacity should the need arise in the future. As noted above, VSL's stay cable anchorages are designed to be used with either strand size, and therefore the anchorages could sustain the extra loading that would come with any future addition of 0.62" diameter strands.

As one can see from the list above, 0.62" diameter strand has also become the norm for current and recent projects that VSL has worked on here in the USA. As such, it is more readily available from domestic strand suppliers.

VSL therefore proposes to use 0.62" diameter strands on the Transbay Transit Center Bus Ramp project stay cables in lieu of 0.6" diameter strands. The 0.62" diameter strand

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

will meet all of the other criteria specified within the contract documents and the current edition of the PTI Stay Cable Recommendations."

Is it acceptable to replace the 0.6" diameter steel stay cable strands with 0.62" diameter strands?

REQUEST:

SCCI has received the following RFI from VStructural LLC.

After a review of the contract drawings and specifications, the following items are requested for the design of the saddle body/system:

1. Change the tangent points of the saddle to the locations shown in the drawing and provide coordinates to VSL for final design

2. Review the Stay Cable Data on Sheet No. S-6079 and update as necessary. In particular, it appears that Note 3 may need to be revised to reflect the revised conditions.

3. The stay cable strands are continuous through the saddles. Update stay cable lengths "Ls" and nominal stay steel weights "Ms" in the table on Sheet No S-6079 to reflect the cable lengths from bearing plate to bearing plate, inclusive of the saddle in the pylon

4. Provide work points at the bearing plate location on the deck

5. Provide cable rotation in ULS and FLS (characteristics and fatigue)

6. Provide angular rotation of each anchorage under ULS, SLS, FLS

7. Provide tension variation under SLS, ULS, FLS

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Kevin Clinch 10/10/2014:

1. See attached SK-S-0010 and SK-S-0011. The coordinates of the tangent point can be determined by the Contractor using the information provided. Note: The northings and

eastings of the "P" points have been revised in accordance with the response to RFI B0033. See attached SK-S-0014.

2. The Stay Cable Data table and the notes have been revised. See attached SK-S-0012 and SK-S-0013.

3. Cable lengths and nominal stay steel weights have been updated. See attached SK-S-0012 and SK-S-0013.

4. Work points at the bearing plate can be determined by the Contractor using the information provided.

5. See attached Excel file RFI B57 Saddle.xlsx.

6. See attached Excel file RFI B57 Saddle.xlsx.

7. See attached Excel file RFI B57 Saddle.xlsx.

B-0059	BRP - Hangers for Slurry Lines off Of Fremont St. Off-Ramp	Closed	09/18/2014	09/28/2014	09/30/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Webcor Construction LP Claude Titche

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

As shown on the Site Logistics Plan, Submittal TG 1801-81.1 , Case Pacific's mud plant and baker tank will be staged in Lot H, North of Clementina St. In order to provide slurry and water to the CIDH locations in Lots G and I, SCCI has installed trenches across Clementina St. and Tehama St. for piping. However, due to the number and type of utilities (shown on the attached excerpt from SCCI Transmittal WOJV-0001 - Utility Locates per USA North) below Folsom Street, SCCI would like to avoid trenching at this location by hanging two 4" slurry pipes from the Fremont Street Off-Ramp. Based on this, SCCI has two questions:

1. Will Cal trans allow SCCI to install hangers of any sort from the Fremont Street Off-Ramp to facilitate this work?

2. If yes, is the attached detail provided by Case Pacific (SK-I) acceptable?

SCCI will work to prevent damage to the existing structure and would be responsible for any repairs caused by these hangers.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Bashar Dayoub 9/23/14

This is SCCI & Sub Means and Methods

WO need to facilitate approval from Caltrans and City
We recommend to pursue this method as a last resort

B-0063 **BRP - Pylon and Barrette Reinforcing Conflict** **Closed** **09/26/2014** **10/06/2014** **10/13/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Webcor Construction LP Claude Titche

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REQUEST:

Please review the attached sketch as it pertains to the Pylon 9 vertical reinforcing and the Barrette vertical reinforcing. Please confirm the length of the horizontal hook on the Pylon vertical bars, normally if the hook length is not specifically called out it is considered to be a standard hook (in this case 1-10).

Additionally, to avoid conflict between the Pylon and Barrette vertical reinforcing and to facilitate the setting of a pre-built Pylon cage we propose to use an HRC-555 on the outside face bundled vertical bar and tum the inside face bundled bar inward as shown in the attachment. Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Kevin Clinch 10/9/2014:

The hook shown at the bottom of vertical reinforcement shall be a standard hook.

It is acceptable to use an HRC-555 on the outside face bundled vertical bar and tum the inside face bundled bar inward as shown in the attachment.

B-0063.1 **BRP - Pylon and Barrette Reinforcing Conflict** **Closed** **11/05/2014** **11/15/2014** **11/12/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Please review the attached sketch as it pertains to the Pylon 9 reinforcing and the barrette vertical reinforcing. Please confirm the length of the horizontal hook on the pylon vertical bars. Normally if the hook length is not specifically called out, it is considered to be a standard hook (in the case 1'-10").

RFI B-0063 - In the original RFI CMC Rebar asked to use HRC-555 on the vertical bars. In fact, CMC's intent was to request the use of an HRC-555 on the top #11 footing bars that will pass through the Pylon vertical reinforcing. This will facilitate the installation of the top footing bars.

Is the acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Substituting an HRC-555 head for a standard hook at the top #11 bars where they pass through the pylon is acceptable provided there is no additional cost to the TJPA. Provide 3" concrete cover at the face of the head and the edge of the head. The orientation of the headed end vs the hooked end shall be staggered. Comply with the requirements of Specification Section 03 20 56.

REQUEST:

Please reference CD S-6070. On sheet S-6070 Pjack is given as 1095 Kips. Is this per tendon?

Please clarfiy

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Pjack = 1095 kips at top prestressing, Pjack = 1095 kips at bottom prestressing. We assumed 0.6" diameter x 25 tendons at each the top and bottom prestressing.

B-0065	**BRP - Use of Non-Domestic Stay Cable Wedges**	**Closed**	**09/30/2014**	**10/10/2014**	**10/09/2014**	**Potentially**	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

VSL is proposing to use non-domestic wedges for the stay cable system to be supplied on the Transbay Bus Ramp Project. This request is based on the following:

-The wedges make up a very small portion of the total steel quantity on the project, yet serve a critical role in anchoring the cables of the stay cable system.
- VSL has used the same proprietary stay wedges (VSL Switzerland) on all US stay cable projects for more than a decade, including projects that were governed by the "Buy America" provisions.
- All VSL stay cable projects worldwide utilize stay wedges supplied by VSL Switzerland.
- Stay cable wedges are a specialty item, and at the present time are produced solely by VSL Switzerland exclusively for use with the VSL Stay Cable System.
- 100% of the wedges are inspected and approved by VSL Switzerland as part of our quality process prior to shipment to the projects.
- All fatigue and static strength tests on VSL's stay cable systems have utilized wedges produced by VSL Switzerland.
- The wedges cannot be produced in sufficient and reasonable quantities in the USA and there is no domestic product that is equal in quality to the wedges VSL is proposing.

Pursuant to the "Buy American Provisions" as well as the guidelines in Subpart 25.3 of the "Federal Acquisition Regulation," a waiver for non-domestic materials may be

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

TJPA please respond.

See attached

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

granted if it is determined that (1) "the application of 'Buy American Provisions' would be inconsistent with the public interest and/or (2) such materials are not produced in sufficient and reasonably available quantities and of a satisfactory quality."

VSL proposes that wedges be manufactured in either Spain or Brazil and heat treated in Switzerland for the Transbay Project. The total cost of these materials is $5,250.00.

Is this acceptable?

B-0066 **BRP - Vertical Alignment of CIDH Piles** **Closed** **10/02/2014** **10/12/2014** **10/06/2014** **Potentially** ☐

See the attached sketch of the proposed OCS pole relocation per SCCI's field walk with Turner, MUNI, and WOJV on 10/2/2014. Please provide direction on scope with design documents and specifications for construction.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

RESPONSE TO RFI B-00069:

The attached sketch provided by the Trade Subcontractor for a temporary configuration of the Howard Street OCS system during the bus ramp construction is helpful and has been forwarded to SFMTA/MUNI. To assist the Contractor, the

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

SFMTA/MUNI will provide a revised Howard Street OCS system design including pole type, pole locations and OCS configuration of this area and also seek to locate the OCS poles so they do not move again after bus ramp construction completion.

However;

To assist the SFMTA/MUNI for the OCS system re-design , the Construction Manager/General Contractor is to coordinate delivery of appropriate Bus Ramp construction drawings at Howard Street (CADD file) to SFMTA/MUNI.
The OCS system design for construction (OCS poles, foundation, connections etc.) is not within the scope of the Bus Ramp Project design, but are a City of San Francisco SFMTA/MUNI design. Construction Manager/General Contractor or Trade Subcontractor is to obtain the OCS pole location, pole type and foundation type and systems design from SFMTA/MUNI.
The OCS system specifications for construction (OCS poles, foundation, connections etc.) is not within the scope of the Bus Ramp Project specs, but are a City of San Francisco SFMTA/MUNI system specifications standards. Construction Manager/General Contractor or Trade Subcontractor is to obtain the OCS pole location, pole type and foundation type and system specifications standards (SF Municipal Railway Engineering Standards) from SFMTA/MUNI.
Please also refer to Pre-Bid RFI No. TG18.1-077

Information Requested: Regarding the overhead power lines for lighting and transportation (buses): Will the lines be relocated during falsework installation and removal? What is the work window? Who is responsible for the cost of this work?

Response: If the falsework designed by the Trade Subcontractor requires OCS relocations, the Trade Subcontractor is responsible for relocations, restorations and all necessary permissions including all associated cost. If relocation is not required, existing OCS must be protected in order to uphold the safety of the public transportation system

B-0072	BRP - Clarification of Specification Section 31 63 32	Closed	10/13/2014	10/23/2014	10/15/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Section 3.4-B-1 of Contract Specification Section 31 63 32, States:

"Do not begin excavation of the barrette piles until geotechnical instrumentation for monitoring ground movements, other than that to be installed within the barrette pile itself, is installed and stabilized baseline reading sets have been taken."

Please provide clarification as to what geotechnical instrumentation outside of the barrette pile has been installed and who is monitoring it. If baseline readings have been established, please provide them.

Additionally, please provide clarification as to what geotechnical instrumentation is to be installed within the barrette pile to monitor ground movement.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The survey targets on the tops of the soldier piles are currently not being read by an AMTS due to the unexpected request to remove the AMTS from the top of 545 Mission. The inclinometer I-40 is not accessible because it is beneath the crane mat. Therefor, Contractor shall perform an optical survey of the survey targets on the tops of the soldier piles to obtain a baseline reading. The survey targets on the tops of the soldier piles shall again be read following the installation of the barrettes.

B-0078	BRP - Correct PTI Edition	Closed	10/23/2014	11/02/2014	11/04/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

VSL is requesting clarification on the correct edition of the "Recommendations for Stay Cable Design, Testing, and Installation" published by the Post Tensioning Institute (PTI) to be used on this project.

On drawings S-0005 (71 of 470) dated October 1, 2013, the contract drawing refers to the "Recommendations for Stay Cable Design, Testing, and Installation" Fifth Edition (2007) by the Post Tensioning Institute (PTI) as the basis for design of the bridge.

On page 05-16-33-1, section 05-16-1.2-C-1, of the project specification, dated October 1, 2013, the specifications specify the "Latest edition issued" be the standard for the project. The latest edition of the "Recommendations for Stay Cable Design, Testing, and Installation" published by PTI is the Sixth Edition dated May 2012.

Please clarify which edition of the "Recommendations for Stay Cable Design, Testing, and Installation" as published by PTI should be used on this project.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The latest edition shall be used. Therefor, use the Sixth Edition dated May 2012.

B-0079	BRP - AWSS Submittals	Closed	10/24/2014	11/03/2014	10/27/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** City and County of San Fr Michael Smith

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

As confirmed by SFDPW at the AWSS meeting, on 10/23/14, with Synergy Project Management (AWSS subcontractor), SCCI, WOJV, TCCO and SFDPW, submittals are not required for the following items:

AWSS Dewatering Plan
AWSS Valves and Fittings (also see attached email)

Please confirm.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Submittals are not required for the valves and fittings. A submittal for the dewatering plan is not required at this time unless water is encountered at the site.

B-0080 **BRP - Anti Ram Barrier Specification** **Closed** **10/28/2014** **11/07/2014** **11/17/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

SENSITIVE SECURITY INFORMATION

Please see below questions from Shimmick's Anti-Ram Barrier subcontractor, FutureNet.

Question 1
Spec Section 28 16 34, 2.1 A 3 states "the design and structural materials of the vehicle barrier shall be the same as those used in the crash test."

Discrepancy: The original crash tested barriers are installed in dirt for a permanent in-ground installation. This project requires the barrier be installed into a bridge section. The barrier foundation will need to be modified to fit into and react with the bridge section. Dirt reacts differently than a concrete bridge section during impact and the bridge section has space restrictions. Therefore we need to provide a foundation design that varies from the original crash tested design for both fit and function.

Proposed Solution: Allow a modified foundation design, proven to absorb the minimum force via engineering calculations.

Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The response to this question contains Sensitive Security Information and is available only to individuals who have been granted access to the document that is the basis for the question.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Question 2
Spec Section 28 16 34, 2.1 B. I. states "the barrier shall fail when subjected to the maximum input force."

Discrepancy: Anti-ram barriers are not designed to fail. The industry designs to protect against a defined force and to meet or exceed that rating. No barrier company has defined a systems to fail completely. If the barrier absolutely must fail and allow a vehicle access, then we are back to discrepancy #1 which causes a variation from the barrier design as originally crash tested.

Proposed Solution: Remove reference to barrier failure (allowing vehicle access above x weight and speed). The GRAB-300 system currently uses shear pins and energy absorption devises which may mitigate the requirement for barrier failure.

Is this acceptable?

For reference, please see attached cut sheet and sample drawing of a 48' GRAB-300 with standard foundation. TG 18.1 requires a 52' unit (drawings for this size are not readily available for this RFI), the foundations are identical except wider in the middle. The GRAB-300 foundation needs to be trimmed
on the outside to fit the bridge section.

WARNING: This record contains Sensitive Security Information that is controlled under 49 C.F.R. parts 15 and 1520. No part of this record may be disclosed to persons without a "need to know", as defined in 49 C.F.R. parts 15 and 1520, except with the written permission of the Administrator of the Transportation Security Administration or the Secretary of Transportation. Unauthorized release may result in civil penalty or other action. For U.S. government agencies, public disclosure is governed by 5 U.S.C. Section 552 and 49 C.F.R. parts 15 and 1520.

REQUEST:

Contract Drawing S-2040 provides reference to drawing S-2053 for Retaining Wall 10 details but SCCI is not in receipt of drawing S-2053. Please provide this drawing if it exists.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

See attached SK-S-0024 for corrected sheet references

B-0082 **BRP - Removal of Concrete Structure in Lot A** **Closed** **10/29/2014** **11/08/2014** **11/04/2014** **Potentially** ☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Offhaul of hazardous material and excavation around existing foundations in Lot A have exposed what appears to be a spread footing for a previously demolished concrete wall. The concrete is 2'-0" wide by 1 '-6" tall and 85'-0" long with rebar extending vertically out of it. SCCI has checked all reference drawings and was unable to determine what this structure was and when it was built. This concrete will interfere with the future installation of Retaining Wall 10. SCCI proposes to demolish this concrete structure and bill towards Bid Item 25 Demolition/Removal of Concrete Foundations.

Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Demolish this concrete structure to allow for construction of the MSE wall.

B-0084	BRP - Barrette Pile Concrete Allowable Delivery Time	Closed	10/31/2014	11/10/2014	11/17/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Section 2. 7 C 6 c. of Specification Section 03 05 15 Portland Cement Concrete - Bus Ramps states that concrete that uses an admixture to retard the set time has a time limit from batch to placement of two hours. The mix design for the concrete to be used in the Barrette Piles uses admixtures that ensure that the slump is greater than seven inches up to eight hours from batch time. Therefore, SCCI proposes to revise the allowed time from batch to placement to three hours. This would apply to approved Barrette Pile mix designs only.
Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Revising the allowable time from batch to placement to three hours is acceptable provided the trial batch tests show that the mix retains its slump value in accordance with the specifications, and the mix temperature does not exceed 80 degrees at time of placement.

B-0092	BRP - Proposed Mofification to Welded Barrette Pile Reinforcement	Closed	11/06/2014	11/16/2014	11/06/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

A Quality Control inspection was performed by Nicholson on the reinforcement cage of Barrette Pl. During the inspection, it was observed that 2 ea. 3"x3"x0.25" angles (which are part of the assembly to pick the cage) are welded to a total of 4 ea. #10 structural bars (2 bars on each angle).

After a discussion with ARUP, Nicholson proposes to install 4 ea. additional #10 bars 13' long to lap splice the structural bars affected by the weld. Those additional #10 bars will be centered on the weld location and installed before the Barrette is poured (see attached sketch).

Alternatively, if the additional #10 bars cannot be supplied in time, Nicholson proposes to install Lenton mechanical couplers at the weld location.

Please confirm this modification is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable. If the coupler option is chosen, stagger the splices.

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Please see the attached sketches. Per the contract drawings, a signal control box located at the NW comer of Harrison and Essex is 2' away from the retaining wall and is noted "to remain." The actual location is only 1' away which is in conflict with the footing of the retaining wall to be demolished.

Please provide direction on how to proceed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The existing traffic signal box shall remain and shall be protected during demolition and all subsequent work. If a footing is located below the box, the footing shall remain.

B-0098 **BRP - Traffic Light Relocation** **Closed** **11/11/2014** **11/21/2014** **11/13/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Turner Construction Comp Jack Adams

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Please see attached schematic showing the locations of street lights and poles that will be in the way of the new structure and falsework. Per contract drawings U-1003 through U-1006, SCCI is instructed to relocate one street light and deenergize and demolish two street lights. The rest of are not shown on the contract drawings or include a note stating "street light removed." Please provide direction on how to proceed with the removal/relocation of these street lights not shown on the contract drawings and those that SCCI assumed were already removed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

See reply enclosed

B-0099 **BRP - Additional Pylon Dimensions** **Closed** **11/12/2014** **11/22/2014** **11/25/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Please see attached preliminary drawings of cable saddles from VSL. VSL needs confirmation on the blister dimensions as well as the work points. Also, any definition of pylon dimensions would be helpful. currently, the only pylon dimensions that we have is shown on Drawing S-3173.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The pylon dimensions are shown on S-3173 with additional dimensional information shown on S-3178 and S-3179.

See attached Excel file for work points. These are based on the locations of the EP, WP and TP shown on the Contractor's drawing included with this RFI and a revised drawing sent to us on 11/19/14. Contractor to verify these work points.

B-0100 **BRP - Additional Pylon Geometry** **Closed** **11/12/2014** **11/22/2014** **11/17/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

See attached e-mail/sketch of the pylon 9 orientation from VSL. Please provide coordinates to one of the vector orthogonal to any face of the pylon.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The orientation of the pylon is shown on S-2261.

B-0101	**Bent 8 Footing Rebar**	**Closed**	**11/12/2014**	**11/22/2014**	**11/17/2014**	**Potentially**	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Please review the attached plan excerpt and acknowledge that it is acceptable to use an HRC-555 T-Head on the # 11 top and bottom bars that pass thru the column vertical reinforcing. This will facilitate installation. The HRC-555 and the 90 regular right angle would be alternated.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Substituting an HRC-555 head for a standard hook at the top #11 bars where they pass through the columns is acceptable provided there is no additional cost to the TJPA. Provide 3" concrete cover at the face of the head and the edge of the head. The orientation of the headed end vs the hooked end shall be staggered. Comply with the requirements of Specification Section 03 20 56.

B-0102	**BRP - Pile Tip Elevation of CIDH 6-2**	**Closed**	**11/13/2014**	**11/23/2014**	**11/13/2014**	**Potentially**	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Turner Construction Comp Jack Adams

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

While drilling CIDH 6-2 Case Pacific hit refusal at an approximate elevation of -73.3' due to extremely hard rock. The CIDH Table on Contract Drawing S-3190 calls for a pile tip elevation of -75.9' but SCCI is proposing to cease drilling and revise the pile tip elevation of -73.3'. The cut-off elevation of 26.3' would not change.

Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable.

B-0103	**BRP - Stainless Steel Convex Plates**	**Closed**	**11/13/2014**	**11/23/2014**	**12/01/2014**	**Potentially**	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Per section 03 15 16, the Convex Plates for the PTFE Bearings must comply with ASTM A240, Type 304 stainless steel. The maximum thickness of convex plates at Hinge 9 and Hinge H are 3" and 3.5" respectively. This thickness is not available in Domestic ASTM A240 Type 304 stainless steel plates. Please advise if another specification is acceptable for the convex plates at Hinge 9 and Hinge H (ie ASTM A276 stainless steel). Please note: If ASTM A240 is required for the convex plates at Hinge 9

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

We understand ASTM A240 Type 304 stainless steel plates are available in the thicknesses required from Samuel Plates Sales.

If not, submit a copy of the ASTM A276 standard for review.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

and Hinge H, WOJV will issue a 'Buy America' substitution request.

B-0104 **BRP - Stay Cable Forces** **Closed** **11/17/2014** **11/27/2014** **12/01/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Per the conference call between OPAC and Arup on 11/13/2014 to discuss OPAC's current stage-bystage time dependent erection analysis, OPAC finds slightly higher final stay cable forces than shown on drawing S-6097, about 10% to 15% higher. Please advise on which of the following cable tuning options is preferable?

1. The cables tuned such that, although the forces are higher, they result in a similar pattern as S-6097.
2. The cables tuned such that they all have approximately the same force, say approximately 12% of the ultimate strength.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Arup and OPAC had a conference call on 12/1/14. Arup understands that OPAC has prepared an erection analysis and an erection plan that provides more detail and would assist us in evaluating the question in this RFI. Contractor to forward the erection analysis to Arup for our review.

Note: Specification Section 34 80 06 requires the Contractor to submit a conceptual erection plan prior to submitting a final erection plan. Arup has not yet received this.

B-0105 **BRP-Pylon 9 Footing** **Closed** **11/18/2014** **11/28/2014** **11/25/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

See attached marked up drawings of the Pylon 9 footing shoring. SCCI is proposing to pour the (N) Pylon 9 footing against the temporary shoring wall, as shown on the attached drawings. A plastic sheet (visqueen) will be attached to the temporary shoring wall to provide a bond breaker for easier extraction of the shoring system.

Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable for the removal of steel plates.

Regarding the soldier piles, the portion of the soldier pile below the bottom of the pile cap may not be removed by pulling.

be replaced with a splice bar that overlaps the end of each uncoupled bar by 6'-6".

acceptable between the second and third cages.

At barrette plile P9-2, two lap splices in lieu of couplers are acceptable between the first and second cages. Two lap splices in lieu of couplers are acceptable between the second and third cages.

B-0109 **BRP - Lighting Under Overpass** **Closed** **11/19/2014** **11/29/2014** **12/01/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Per discussions with Turner/WOJV, there has been discussion on what the final street lighting configuration on Natoma, Howard, Tehama, Clementina, Folsom and Harrision streets shall be. Per the contract electrical drawings, there are no lights installed in the bridge soffit, only lights to illuminate the top surface of the bridge. The utility demolition plans and the response to RFI 098 directs SCCI to remove and salvage numerous street lights. There is no item within our scope of work to re-illuminate the city streets after we remove the temporary lights and bridge falsework. Please verify if this is the contract's intent, or provide a change order and direction to install permanent lighting on the streets or bridge structure.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Street lighting temporarily removed by the Contractor will be restored to the original pole foundation location upon completion of bus ramp viaduct unless. Existing street lighting will be salvaged as defined on the contract drawings. Any changes to existing street lighting, relocating or adding street lighting to ¿re-illuminate the city streets¿ after Contractor removes their temporary lights and bridge Falsework, will be determined by City of San Francisco BLHP and would be issued in a Change to WOJV and may not be assigned to the Bus Ramp Contractor.

B-0119	BRP - Protection of Transverse Rebar in Fremont Off Ramp	Closed	11/24/2014	12/04/2014	12/01/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Per Contract Drawing D-1007, a 3'-0" section of the Fremont Street Off-Ramp is to be demolished. Per Contract Drawing S-5000, the transverse reinforcement in the 3'-0" section is to remain with no damage. SCCI and its demolition subcontractor, Evans Brothers, plan to take measures to satisfy this requirement and protect this reinforcement in place. However, it is possible that reinforcement is damaged during the demolition process. In the case of a transverse rebar being damaged, SCCI proposes to install a #6 dowel with 1 O" embedment with Hilti RE-500 epoxy adjacent to the damaged rebar ensuring that the necessary 2'-0" lap splice is provided.

Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable provided non-destructive testing methods are utilized to locate in-situ reinforcement prior to drilling and provided the number of damaged bars does not exceed 10% of the total number of bars exposed. If, as the work progresses, the total number of damaged bars exceeds 5% of the bars exposed to that point, the work shall stop and demolition methods re-evaluated.

B-0121	BRP - Guard Booth Equipment Cabinet	Closed	12/01/2014	12/11/2014	12/09/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author:

REQUEST:

Please see below RFI from WPCS, SCCI's security and communication subcontractor.

Specification 27 1117 3.1.C. l , requests a Cabinet to be a minimum of l 8RU with a usable depth of 32" and sized to fit within the footprint of the guard booth. Upon looking into the B-line wall mount cabinet
WPCS submitting on as an "or equal ", WPCS have looked into all the other manufactures listed as well as additional manufactures, and have found that no manufacture offers a half size wall mount cabinet with 32" of usable depth. The only way the specification can be met is if a full size 7' minimum cabinet were to be installed, however taking into account that this cabinet is being located in a fairly small guard
shack, a full size cabinet will require a larger foot print and may not be the designer's intent.

1. Please confirm the specification requirements are correct. If not, please provide new cabinet dimension criteria.
2. If specification is confirmed, please confirm a full size

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

See attached response from SMW.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

cabinet is what is desired to be installed in the guard shack.

B-0122 **BRP - Seat Extender at Hinge 9** **Open** **12/09/2014** **12/19/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:**

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

1. During the December 1, 2014 conference call to discuss the seat extender/vertical restrainer, Arup stated that the seat extender/vertical restrainer was initially intended to perform as only a vertical restrainer. As shown on the bid drawings and incorporated into OPAC's redesign, if the bridge falls off of its bearing, any deflection of the seat extender/vertical restrainer pipe would prevent the bridge from reseating on the bearing. An alternative to the seat extender would be to follow Caltrans MTD 20-22, "Seismic Design of Bridges with Isolation Bearings", which recommends that isolation bearings, such as PTFE sliding spherical bearings, have adequate sliding surface to permit 1.25 times the MCE displacement and that unseating be prevented through the use of catcher blocks at displacements higher than 1.25 time the MCE displacement. Is it acceptable to replace the seat extender component of the seat extender/vertical restrainer with bearings designed according to Caltrans MTD 20-22?

2. As discussed and agreed upon, during the December 1, 2014 conference call, the Hinge 9 pipe vertical restrainer shown in the bid drawings and incorporated into OPAC's redesign prevents the Hinge 9 bearings from rotating as intended. Arup proposed providing a gap between the restrainer pipe and vertical restrainer assembly to allow the Hinge 9 bearings to rotate as intended. OP AC commented that a gap would allow for some uplift at Hinge 9. Arup agreed and said that some uplift maybe acceptable. We find that the vertical restrainer assembly requires a 2.5" gap top and bottom for the Hinge 9 bearings to be able to rotate the 2 degrees as specified. Is a 2.5" gap acceptable for the vertical restrainer assembly to perform as intended?

SUGGESTION:

B-0125	BRP - Lap Splice of CIDH 4-1 Reinforcement Cage	Closed	12/03/2014	12/13/2014	12/04/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

The rebar cage for CIDH 4-1 was fabricated with "C2" bars 80'-0" rather than the 84'-0" length required by Contract Drawing S-3190 and the approved shop drawings, Submittal TG1801-345.1. SCCI proposes to install a lap splice with a lap length of 8'-9" above the bottom of the installed C2 bar.

Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is acceptable.

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Turner Construction Comp Steve Cunningham

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Please see attached visual interpretation of the survey notes from RFI#132 of the (E) electrical duct bank at (N) Abutment 1. As noted in previously submitted SCCI's RFI # 132, per contract drawing U-1003, note 5, the existing electrical line is to be relocated by PG&E. Per Turner's direction, a survey was performed to see if removal was necessary (survey attached). SCCI believes this duct bank is above the sidewalk grade if the structure is to remain. Please confirm this line is to be relocated.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Following discussion during the Wednesday weekly progress meeting on 12/10/14. The approach to address the existing 12kv ductbank at Harrison Street Abutment #1 is as follow:

Shimmick to evaluate if they can complete demolition and install new work while protecting the existing 12kv ductbank in place? SCCI will submit their plan and cost impact for review?

SCCI plan will be submitted to PG&E to gain their approval.

Arup have confirmed that the existing ductbank does not appear to have significant impact on the structural components at Abutment #1.

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Per Caltrans Detail B7-6, the deck drain pipe exits the columns 6" above finished grade. This is inconsistent with the attached civil and structural sheets showing slots in the catch basins for the pipes to enter.

Please clarify which detail is to be used for the connection between the deck drainage and the catch basins.

B-0136 **BRP - Utility Conduit Clarification at Pylon 9** **Closed** **12/15/2014** **12/25/2014** **12/22/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Per contract drawing S-3173, the utility conduits leave Pylon 9 from the base of the column. Per contract drawing E-5006, the utility conduits leave Pylon 9 from the pile cap. SCCI proposes to have the utility conduits leave Pylon 9 from the base of the column as shown in contract drawing S-3173. Is this acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The utility conduits shall leave Pylon 9 from the base of the column, not from the pile cap. The elevation at which the conduit leaves the pylon shall be coordinated with the TTC work in the area of the vehicle and bike ramp.

B-0137 **BRP - Barrier Gate at Harrison St. Off Ramp** **Closed** **12/15/2014** **12/25/2014** **12/19/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Contract drawing E-3000 calls out a semaphore arm at the Harrison St off ramp, which is in a different location to the barrier gate shown in the civil drawings (see attached).

1. Please confirm the barrier gate is a 20' arm barrier gate, not a semaphore arm.
2. Please confirm the location of the barrier gate is per the civil drawings, not E-3000.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. The barrier gate is a 20' arm barrier gate.

2. The location of the barrier gate shall be according to the civil drawings, not E-3000.

Co-Author:

REQUEST:

Contract Doc Ref:
Sheet MA-0
Specification Section 02723

Location:
Bus Ramp

Add'l Doc Ref's:
RFI B-0139 Response

Further to WOJV's response to RFI 0139, SCCI would request to proceed with the work as follows:

1. Excavate and begin demolition of the upper abutment at the Caltrans lot. This Abutment is well clear of the AWSS line based upon the as-built drawings, USA markings, and a surface field investigation, where trench lines in the pavement are clearly visible.

2. As demolition of the upper abutment is ongoing, SCCI will pothole the AWSS near the lower abutment and sidewalk. The information gathered from this potholing will be transmitted to WOJV at this time.

3. Once it has been determined if the AWDD is far enough from the demolition work to safely remain in service, SCCI will proceed with the excavation and demolition of the lower abutment and sidewalk. If AWSS is in conflict with the excavation and demo work, SCCI will proceed with

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

excavation and demo to th extent that is safe and practical to do so with the line remainging in service. The remainder of the excavation and demo will occur after the AWSS phase 1 removal and cap installation is complete.

SSI believes the intent of the drawings and notes to state that the AWSS system can only be disconnected for a maximum of 6 months to facilitate construction. By proceeding with the demolition and excavation work that does not affect the AWSS, SSI will be able to leave the AWSS in service longer than originally anticipated and reduce the downtime that this line must be sent out to service, which serves both the project and pubic interest.

Please advise if the above sequence of work is acceptable.

B-0140 **BRP - Overhead Sign Structures Signal Face Dimension** **Open** **12/18/2014** **12/28/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:**

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:

Contract Doc Ref: 31 63 30
Location: Bus Ramp

Contract Specification Section 31 63 30 - Cast-In-Drilled-Hole Piles details the material and testing requirements for the bentonite slurry used in the CIDH piles. This specification states that slurry testing should be performed every two hours. Per Case Pacific's experience, the slurry in the shaft during the drilling operation will not meet the specifications per the Mineral Slurry Requirement table in Section 2.4-A-6 because suspended material created by drilling will make the slurry thicker. Therefore, SCCI and Case Pacific propose to only test the bentonite slurry in drilled CIDH shafts once the slurry has been recirculated before the concrete placement. Per Arup's previous request, slurry testing will be possible after periods of 48 hours of no drilling operation.

Please confirm that this is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Location: Bus Ramp
Add'l Doc Ref's: VSL - Trade Subcontractor RFI (Attached)

The amount of load transferred into the stay cable by the armor is 2,350 lbs. The stay pipe armor is supported by a collar that clamps on to the strand bundle. The stay pipe armor is approximately 6.6 ft long and weighs 1,630 lbs. The fire pipe sits on top of the stay pipe armor. The fire pipe is approximately 16 ft long and weighs 720 lbs.

VSL is requesting clarification from the designer on the following:
Please confirm the weight of the armor has been included in the stay cable catenary.

Please note that this has been coordinated with the OPAC.

B-0157 **BRP - Proposed Telecommunication Line Relocation Location** **Open** **12/22/2014** **01/01/2015** **Potentially** ☐

To: Webcor Construction LP — Masashi Kojima
Answered By: Webcor Construction LP — Masashi Kojima
Co-Author:

REQUEST:

Reference Project Bidding Manual (Exhibit A)

Per the requirements outlined in the project bidding manual (Exhibit A), BBII has developed our trestle design to provide access for Natoma street extending from gridline 11.5 at the center of the excavation (grid line E) to gridline 10 at the centerline of the shoring wall. After staking out this point on the shoring wall, it is apparent that the 530 Howard St. building is in conflict with the access point. See the attached sketch and photos indicating the approximate location of 530 Howard in relation to the trestle access. Please advise if the Natoma St. access point should be changed to a more suitable location.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The geometric requirements for Access Trestle in Exhibit A, A3 and SL-001 are schematic and minor adjustments can be acceptable based on the actual site conditions.
For this particular item, it is acceptable to shift the Natoma Access of the Access Trestle to west by approximately 30 ft.

Co-Author:

REQUEST:

Reference Project Bidding Manual (Exhibit A)

Per our discussion at our meeting on 4/26/11, the response to BBI RFI 076 indicated that BBII should relocate the access trestle but was not specific enough. Please provide an exact location for the Natoma St. offshoot that will satisfy the access requirements of future trade subcontractors. BBII requests a meeting to discuss any impacts of the relocation.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Access Trestle design should be included in BSE Trade Subcontractor's scope.

The geometric requirements for Access Trestle in Exhibit A, A3 and SL-001 are schematic and minor adjustments can be acceptable based on the actual site conditions. The "exact" locations should be designed by BSE Trade Subcontractor as the Design-Built scope.

Also, please refer to the General section regarding to the coordination in Exhibit A, Attachment 3.

BALFO900-0002 **BSE - Scaffolding For Interim Screen Wall** **Closed** **03/21/2011** **03/31/2011** **03/22/2011** **Potentially** ☐

REQUEST:

Reference Specification Section 31 56 13

In reference to the CDSM Shoring Wall DFOW QC meeting held in BBII's office on June 1, 2011, please find below the following RFI submitted by BBII's sub-contractor DND Construction:

"The reference specifications for tolerance relative to centerline of wall for both the CDSM and steel soldier beams are extremely strict compared to what is common for this nature of work, particularly given the depth of the work. It is also more strict than if the verticality tolerance (1:150 CDSM/1:200 pile) is applied at a conservative excavation depth of 60 feet. Can the tolerance be changed from 0" in/2" out (CDSM) & 0" in/3" out (piles) to a uniform 0" in/4" out"?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Trade Subcontractor is responsible for the necessary means and methods to install the CDSM Shoring Wall within the tolerances specified in Specification section 31 56 13.

Answered By: Webcor/Obayashi Joint V Masashi Kojima

Co-Author:

REQUEST:

Reference RFI #T-0251.1 and Specification Section 01 53 13

In order to avoid conflicts with both the Thornton Tomasetti "pile exclusion zones" provided in response to RFI T-0251.1, the first trestle pier near gridline 3 must be relocated. BBII Proposes two options:

Option A - Move the last pier East to clear the pile exclusion zones and adjacent bracing struts, resulting in a trestle deck that ends approximately 15' East of gridline 3. The capacity of this end span would be increased to allow for the additional reach.

Option B - Move the last pier West and extend the end span to clear the pile exclusion zones and adjacent bracing struts, resulting in a trestle deck that ends approximately 20' West of gridline 3.

Please advise how BBII should proceed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

REVISED RESPONSE to BALFO900-0013: Option A

REQUEST:

According to Exhibit A - Rev H of the trade subcontractors bid manual. "Temporary poles shall include conduit for security cameras, power at the pole tops for security cameras, and mounting hardware for security cameras." Please advise on quantity and the location of these temporary poles.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Per Exhibit A - Rev H:
"Trade Subcontractor shall be responsible for installing and maintaining temporary lighting at the perimeter traffic/pedestrian barricades, at pedestrian walkways, and as required to provide code-minimum lighting at egress paths, as well as sufficient foot candle lighting levels to safety perform the work at all times, including within the excavation. At a minimum, Trade Subcontractor's lighting plan will include temporary poles at street level. In addition to supporting lighting, temporary poles shall include conduit for security cameras, power at the pole tops for security cameras, and mounting hardware for security cameras. Security cameras will be

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

installed and maintained by others. Temporary lighting work item includes, but is not limited to, installing lighting poles, installing all hardware, switch boxes, breakers, conduits, pulling strings among temporary power skids /generators /lighting poles and maintenance required for temporary lighting works. Trade Subcontractor's lighting plan will be a submittal requirement for the project. Trade Subcontractor is responsible for maintaining the temporary lighting and related facilities for each zone until completion of Mud/Rat Slab construction. Those facilities for Temporary Bridges and Access Trestles shall be maintained by Trade Subcontractor until their removal. Temporary lighting for Staging Areas that may be provided by TJPA shall be maintained by Trade Subcontractor all the time."

BALFO900-0016	BSE- Stabilization of CDSM Wall	Closed	04/10/2012	04/20/2012	04/10/2012	Potentially	☐

From: Balfour Beatty Infrastructure, Inc. Ural Yal **To:** Webcor Construction LP Kirk Nielsen **Answered By:** Webcor Construction LP Kirk Nielsen

Co-Author:

REQUEST:

BBII is requesting direction for a method to stabilize the unimproved soil conditions along the interior face of the CDSM wall. This request was generated after a field review of the wall conditions revealed a potential safety issue regarding workers working on the mass excavation, bracing and dewatering activities

The current condition of the CDSM wall includes unimproved soil conditions that have the potential to become detached from the wall and create a falling safety hazard to workers as the mass excavation and bracing reach lower depths.
Please reference attached photo for visual details.

Based on our records, the CDSM wall met all the specification requirements for uniformity and improved soil as per section 31 56 13 of the contract specifications.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

During the 4/4/12 BSE meeting AAI indicated that a RFI was not the correct format to inquire with regard to a safety issue the responsibility of the contractor. Further in addition to the +1" cavity issue per section 31 00 00.3.8.L, contrary to section 3156 13.3.7.C which indicates no individual lump of unimproved soil shall exceed 6", there are a pervasive amount of +6" lumps of unimproved soil throughout the CDSM. W/0 will contact a waterproofing manufacture to investigate this issue further. KN 4/6/12

REQUEST:

Based on the discussions at today's BSE meeting, BBII understands that the W/O's intention is to relocate the Beale Bridge from the location depicted in BBII's current submittal in order to accommodate work of future trade packages. Please provide detailed information regarding where to place the bridge, and what horizontal and vertical clearances are required.
Time is of the essence for BBII to receive this additional, previously unavailable information, so the re-design process can be started as soon as possible.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Refer to TCCO response to submittal TG0300-206.1.

BALFO900-0019 **BSE - Removal of Over Head Power Lines In Lot N** **Closed** **10/08/2012** **10/19/2012** **10/09/2012** **Potentially** ☐

From: Balfour Beatty Infrastructure, Inc. Ural Yal **To:** Webcor Construction LP David Fields **Answered By:** Webcor Construction LP David Fields

Co-Author:

REQUEST:

In order to construct the Beale Street Bridge per submittal: TZ1030-015313A38, it must be pre constructed in Lot N. In order to do this the overhead power lines located on the east side of Lot N must be taken down throughout the bridge deck fabrication phase and during the final installation of the deck on Beale Street.
The attached drawing illustrates the fabrication area in Lot N and the location of the overhead power lines through this area. BBII will also need to acquire a section of the W/O lot to complete the bridge deck fabrication.
Please confirm that these items will be resolved before the Beale Street Bridge deck fabrication commences.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Submittal TZ1030-015313A38 was returned "Not Reviewed" on 10/3/12. BBI's Beale St. bridge layout proposal is currently under review by the TJPA as RFI T-0264.7.

In response to the existing utility facilities inquiry: Contractor to follow the provisions set forth in the contract documents regarding existing utility facilities.

In response to inquiry relative to W/O lot south of pacel pacel N:
Infringing on W/O's lot south of lot N in order to construct the Beale St. Bridge is a Trade Subcontractor is means and methods issue. As a result, all cost associated with this work would be borne by BBII. In order for W/O to respond relative to the logistics of this inquiry at a minimum a plan demonstrating the following would need to be provided:

-W/O's trailer complex will maintain ADA compliance. Drawing(s) should show relocated K-Rails and other

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

pertinent information relative to W/O's Trailers and other facilities.
- Expected duration of the infringement into W/O's Lot.
- Demonstration that areas disturbed will be restored to original condition upon the completion of Beale St. bridge installation.

BALFO900-0020 **BSE - Rebracing Supports above the Lower Concourse Level** **Closed** **11/06/2012** **11/16/2012** **11/06/2012** **Potentially** ☐

From: Balfour Beatty Infrastructure, Inc. Ural Yal **To:** Webcor Construction LP David Fields **Answered By:** Webcor Construction LP David Fields

Co-Author:

REQUEST:

In futher review of W/0 letter COM 00479, dated November 2, 2011, regarding rebracing of internal bracing above concourse level, BBII requests the following clarification.

The letter states "internal bracing cannot be rebraced to a pin pile above the concourse level." Are trestle piles considered pin piles in this statement? Also, please clarify why rebracing above the concourse level cannot be supported to pin piles and/or trestle piles.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

BBII elected to utilize the trestle piles to function as reaction elements for its design-build internal bracing system. COM0479 was in response to concerns relative this means and methods decision and was authored to provide notification that trestle pile utilization would not be possible for re-bracing reactions at the lower concourse level given the coordination requirement for trestle removal prior to the final level of rebracing.

BBII may elect to utilize existing piles for rebracing reactions provided the re-shoring and removal sequence is developed and coordinated with Concrete Trade Subcontractor, Structural Steel Trade Subcontractor and other Trade Subcontractors.

Co-Author:

REQUEST:

BBII will be relocating equipment along the North perimeter wall in Zone 3 per W/0 and TCCO direction. Items to be relocated include but are not limited to dewatering header pipe, dewatering control boxes, site electrical, monitoring equipment, etc. Please see the attached photos and sketches and for approval to proceed with relocation of said equipment.

Please confirm the utility locations shown herein do not conflict with other trade subcontractors and can remain for the duration of the dewatering system.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. The direction to evacuate the Muni Hump was provided by QBD #TG0300-0162.
2. WOJV recommends relocating the utilities consistent with BBII's RFI #352 SK(s) 1/2 & 2/2.
3. While WOJV will coordinate as necessary to avoid utility relocation(s) WOJV cannot confirm the utilities may remain the duration of the dewatering system, nor is WOJV obligated to:
a. Specification section 31 23 19.1.3.C instructed bidders to "Locate system components to allow continuous dewatering operations without interfering with installation of permanent Work and existing public right-of-way, sidewalks, and adjacent buildings, structures, improvements and construction operations performed under this Contract or other contracts."
b. Exhibit-A.Section IV.C.15 instructed bidders to "he design and the installation sequence shall be coordinated with Permanent Structure construction, Temporary Structures / Equipment by other Trade Subcontractors, Internal Bracings, Access Trestle, Temporary Bridges and other structures."
BBII was instructed as what to anticipate as it pertains to the permanent structure reference the BSE A-series drawings.

REQUEST:

Ref: GT-1302, Draft 90% Shoring CD's,37 Line; GT-2114, Draft 90% Shoring CD's, Wall Segment 37-1. Please locate from gridline the East shoring wall between Phase 1 and Phase 2 trainbox.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

As we discussed in the Below Grade Structure Workshop on Tuesday Janurary 12th, 2010, the location of the east shoring wall is still in flux. Current indications are that the wall will be located closet to column line 35 than column line 37. Since the location of the wall will coincide with the location of the future seismic joint, PCPA indicated yesterday (Janurary 13th) in a conference call @ 3:00PM that the final design team recommendation is awaiting feedback from Thornton Tomasetti. We expect this decision will be made this week. The final dimensioned location will be documented in the 100% Shoring Construction Documents however it is likely that the final dimensioned location will be available sooner.
The exact dimension is indicated on sheet GT-2013 of the 100% Buttress/Shoring/Excavation Submittal dated 2/26/10. The centerline of the shoring wall is 9'-7 1/2" east of Column Line 35.

P-0023	UR - Existing Water Line At Fremont Street	Closed	03/11/2010	03/25/2010	04/05/2010	Potentially	☐

From: Webcor/Obayashi Joint Venture Manuel Saldana **To:** Transbay PMPC Mark O'Dell **Answered By:** AECOM Technical Servic Eric Zagol

Co-Author:

REQUEST:

Reference: AECOM Early Release Package dated 1-15-10; U-1122, Note 13; U-2023

Sheet U-1122, Note 13 calls for the water line in Fremont Street to be demolished, but not in the early package. Sheet U-2023 of the early package does call for the relocation of a small portion of that waterline between stations 4+00 and 4+50 to accommodate the shoring wall.

After review of the demolition drawings as provided by TJPA to Webcor/Obayashi for reference only, and a field review taking into account the extent of the footings we see a conflict with the (E) water line based on the location of the water line provided thru U.S.A. The footings are extensive and demolition will require shoring that will be very close to the existing water line if not on top of the line.

Please review and provide a solution. Webcor/Obayashi JV believes that a temporary relocation of that water line from station 2+50 and 4+50 is a potential solution.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Sheet U-1123 Note ER10 calls for the demolition of the existing water line between the limits of early release as shown (between STA ~3+80 and ~4+60) due to the existing water line affected by the hammer head portion of the temporary shoring wall.

Sheets U-1122 and U-1123 show the temporary shoring wall for Transbay Terminal footing demolition labeled as ¿TEMPORARY SHORING WALL BY OTHERS¿. The wall is based on information included in the Buttress/Shoring/Excavation package.

Based on the temporary shoring wall as shown in the Buttress/Shoring/Excavation package, the location of the existing water line as shown in the Program Topographic and Underground Utility Survey, and as shown on U-1122, appears not in conflict with the existing water line south of STA ~3+80.

AECOM believes that the water line may be improperly marked by CDD in response to USA ticket recently activated. Blue water line markings in the field show the water in the same alignment as the

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

PG&E HP Gas (steel gas pipe). Based on the Transbay Program Topographic and Underground Utility Survey the existing water line should be ~3.2¿ west of the existing PG&E HP Gas line. Trenching work on Fremont St. at Natoma St. performed by AECOM found the water line to be 3.25¿ west of the PG&E HP Gas line. Additionally, visual observations made by AECOM during PG&E HP Gas work in Fremont St., it appeared that the HP Gas line was in the location as shown on the plans and there was no indication of the water line in the bell hole excavated by PG&E.

AECOM recommends the following:

PMPC/TJPA ¿ provide CAD files that show the location of the temp shoring wall for Transbay Terminal footing demolition. Confirm what is shown in the Buttress/Shoring/Excavation package is accurate.
PMPC/AECOM ¿ Notify SFPUC CDD that they suspect their water line has been improperly marked and request CDD remark the existing water line.
Analyze the above data to determine if the water line is impacted beyond the area already shown for demolition in the Early Release.
Zagol, AECOM 4/5/10

P-0026	Shoring Wall And Buttress Comment Log Clarification Request	Closed	03/19/2010	04/02/2010	04/15/2010	Potentially	☐

From: Webcor/Obayashi Joint Venture Manuel Saldana **To:** Transbay PMPC Mark O'Dell **Answered By:** Transbay PMPC Mark O'Dell

Co-Author:

REQUEST:

Below is a list of questions that provide an overview of information Webcor / Obayashi needs clarified for the Comment Logs provided with the 100% CD Shoring. These are not the only questions we have or will have.

1) The "Design Team Response" comments do not appear to be final answers. For example, the Shoring comments #2 and #5 say items "will" be submitted / provided. What date will they be provided?

2) What date can Webcor / Obayashi expect the final response / answer for items that are unresolved (i.e. #5 on the Shoring Comment Log- "TJPA to respond", and #329 on the Buttress Comment Log - "PMPC to respond.")?

3) What is Webcor / Obayashi expected to do with response comments like Shoring comment #5.10 - "Alternate solutions to the buttress scheme should be considered"; and #5.12 - "Needs further discussion"?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

These comments will be addressed along with the remainder of Webcor / Obayashi Comments dated April 6th 2010 regarding the review of the 100% CD: Buttress / Shoring / Excavation - Issued for Structural Design Review.

P-0027	100%DD Specification Section 07 18 23 & 09 27 13 Discrepancies	Closed	03/23/2010	04/06/2010	03/31/2010	Potentially	☐

From: Webcor/Obayashi Joint Venture Manuel Saldana **To:** Transbay PMPC Mark O'Dell **Answered By:** Transbay PMPC Mark O'Dell

Co-Author:

REQUEST:

In Volumes 1 & 2 of the 100% DD specifications, sections 07 18 23 and 09 27 13 have the following discrepancies:

1) Spec. section 07 18 23 - Vehicular Traffic Coating (02/16/10) is missing from Volume 1 of the 100%DD specifications, but is marked as issued in the Table of Contents. Please confirm spec. section 07 18 23 no longer exists, it's corresponding information has been inputted / consolidated with spec. section 07 18 00 - Traffic Coatings (02.16.10), and update contract documents accordingly.

2) In Volume 2 of the 100%DD specifications, section 09 27 13 - Glass-Fiber Reinforced Plaster-GFRP-Fabrications (02.16.10) is labeled as 09 27 16 in the Table of Contents. Please confirm whether spec. section #09 27 13 or 09 26 16 is correct for the Glass-Fiber Reinforced Plaster-GFRP-

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Confirmed - Vehicular Traffic Coatings are specified in 07 18 00. Spec Section 07 18 23 no longer exists.

2. Section 09 27 13 is correct. There is a typographical error in the Table of Contents.

Fabrications (02/16/10) specification and update contract documents accordingly.

P-0028 **Missing 100% DD Spec. Section 00 30 00 - Desktop Cladding And Secondary Struc** **Closed** **03/23/2010** **04/06/2010** **04/15/2010** **Potentially** ☐

From: Webcor/Obayashi Joint Venture Manuel Saldana **To:** Transbay PMPC Mark O'Dell **Answered By:** Transbay PMPC Mark O'Dell

Co-Author:

REQUEST:

In Volume 1 of the 100%DD specifications, section 00 30 00 - Desktop Cladding And Secondary Structure Wind Load Review (12/14/09) is marked as issued in the Table of Contents, but is not included in the package. Please provide specification section 00 30 0 - Desktop Cladding and Secondary Structure Wind Load Review (12/14/09) or confirm it has not been issued and update contract documents accordingly.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Desktop Cladding and Secondary Wind Load Review Report is listed by mistake. The report is preliminary and not ready for issuance. It was not intended to be issued with the B / S / E Package.

Constructware DRQ #00028

P-0029 **Length Of Concrete Mat Slab Pour** **Closed** **04/01/2010** **04/15/2010** **04/05/2010** **Potentially** ☐

From: Webcor/Obayashi Joint Venture Manuel Saldana **To:** Transbay PMPC Mark O'Dell **Answered By:** Thornton Tomasetti Albert Chen

Co-Author:

REQUEST:

As discussed in previous meetings, please confirm it is acceptable to pour the concrete mat slab in the full width of the project and in up to 400' in length.

(Note: Webcor / Obayashi needs this response for 100%DD estimating purposes.)

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The 100%DD specification, paragraph 3.2.2A limit the maximum length of the concrete pour for mat slab and train box wall to 60ft. This requirement is to minimize heat gain due to cement hydration during the pour and reduce shrinkage induced cracking and plastic settlement. This practice is very common in the construction of large water containment structures that require good quality concrete for water tightness.

Please follow the DD Spec.

Vehicle/Bike Ramp on Howard Street. An interim location is called out on A1-2210 at GL3.

P1-0013 **Traffic Light Details for Wedge Barriers** **Closed** **06/09/2014** **06/19/2014** **06/23/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: A1-2306, A1-2307, A1-2310

Provide traffic light details and locations for all wedge barriers.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

No indicator lights are required at the wedge barriers in the Bus Plaza (sheets A1-2306 and A1-2307). Indicator lights for the wedge barriers at the Vehicle Ramp are now shown on A1-7402 and A1-7418 delivered with MEPTSc Addendum # 4 to be issued on 06/20/2014.

P1-0013.1 **Traffic Light Details for Wedge Barriers** **Closed** **07/25/2014** **08/04/2014** **08/20/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: A1-7402, A1-2306, A1-2307, A1-2310, 28 16 44, P1-0013

RFI response P1-0013: "No indicator lights are required at the wedge barriers in the Bus Plaza (sheets A1-2306 and A1-2307). Indicator lights for the wedge barriers at the Vehicle Ramp are now shown on A1-7402 and A1-7418 delivered with MEPTSc Addendum # 4 to be issued on 06/20/2014."

Original comment remains. 28 16 44, 3.5.I. indicates that wedge barriers provide an output to the traffic control system. Provide details and output requirements. A1-7402 shows one indicator light for two wedge barriers, while 28 16 44 2.3.H. states that each wedge barrier shall have their own light. Clarify what is required.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Wedge barrier controller to provide two (2) dry contact relay outputs to the traffic control system, one per barrier set.

2. Custom pylons shown on A1-7402 and A1-7418 should have indicator lights in front and rear sides of same pylon (one set of lights per barrier/traffic direction).

RFI response P1-0032: "Equipment and detail to be provided by the Operable Barrier manufacturer/supplier. Locations for photoelectric beam pylons identified on updated sheets A1-2302, A1-2303, A1-7402 and A1-7418 included with MEPTSc Addendum # 4, to be issued 06/20/2014."

- Locations of photoelectric beams are not called out on sheet A1-2302, A1-2303. Provide updated details. Also provide details for sheets A1-2304, A1-2306, A1-2307.
- Confirm that photoelectric beam on A1-7402 is wide enough to cover the entire wedge barrier if someone is standing on it.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Location of photoelectric beams are not called out on sheets A1-2302, A1-2303 and A1-2304. However, location of indicator light pylons and/or knox box and key switch + indicator light is clearly shown, (see attached). Per section 28 16 44.2.7.C, Custom Pylons describe two configurations of the pylon matching the annotations on plans. Design of custom pylon, complete with photoelectric beams and other equipment shall be provided by the Bollard Manufacturer.

Additionally, photoelectric beams are not shown on sheets A1-2306 and A1-2307, which describe the wedge barriers at West and East ends of the MUNI Bus Plaza, because they are not required at those locations.

2. Photoelectric beam shown on sheet A1-7402 does not require full width coverage of the entire wedge because of the limited accessibility by the general public and saturated video area coverage.

3. Sheets included with this response include [A1-2302, A1-2303, A1-2304 from ASI 0119], [A1-3100, A1-3105 from ASI 0123], [A1-7402 and A1-7418 from ASI 0121].

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 28 16 44/APA (section 2.6.B),

RFI response P1-0036: "Final location of road loops provided by the Barrier System manufacturer/fabricator. Locations of road loops currently shown on C1-7xxx series. Road loop locations for Howard Street Vehicle Ramp and West Natoma Street barrier to be provided in a future Civil package. Contractor shall obtain quantitites from Contract Documents."

This states that loop detectors are located on both the secure and non-secure side of an operable barrier. The current Civil drawings do not show loops on both sides of the operable barriers, for example on sheet C1-7001. Clarify this requirement.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Road loop sensors to be located at every operable barrier, both on the secure side and the non-secure side.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author:

REQUEST:

Reference: A1-8720, A1-8721 P1-2252, and P1-2202

RFI P1-0051 response: "1. Retractable bollard drains connect to plumbed drainage lines located under the structural slab. Refer to Plumbing drawings delivered with MEPTSc Addendum # 4, issued 06/20/2014.
2. There is no special consideration required for the collected effluent."

- Original question remains for retractable bollard locations at Minna Street on GL 1 and 10 where no drain lines are shown.
- Confirm that both retractable bollard drain and pit drain connect to the single plumbing line as stated on P1-2202 "2" SAN/AD - UP (TYP 9) TO RETRACTABLE BOLLARDS CASING AND PIT".
- P1-2252 states "2" UP TO RETRACTABLE BOLLARD DRAINS (TYP 6)". Please clarify if this drain line is meant to be for the retractable bollard drains and the pit drains.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Arup believes the RFI incorrectly states Minna Street when the question was intended for the retractable bollards at Natoma Street.

The retractable bollards that are located near grid line 1, and the retractable bollards that are located near grid line 10 which are outside the footprint of the trainbox, shall drain to a dry well as shown on the attached two sketches (SK-C-0001 and SK-C-0002).

P1-0062.1	Details for Portland Cement Plaster per RFI Response P1-0062	Closed	07/03/2014	07/13/2014	08/05/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0062

As stated in RFI Response P1-0062, "The system will be changed to portland cement plaster. Details will be revised in a forthcoming ASI. See the work plan distributed to WOJV for the date of this ASI issue."

Per RFI Response P1-0062, revised details using cement plaster in lieu of GFRC are to be issued. No revised details have been received. Please provide the revised detail referenced in RFI Response P1-0062.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

System W-18 Portland Cement Plaster work and associated drawings will be issued in VE Round #4 August 18, 2014.

WOJV helped determine when this package would be issued.

REQUEST:

REFERENCE: RFI P1-0063 Response, Detail 2/A1-9228, Sheet SKA-3667 (IFC Drawings for Main Package dated 3/31/2014)

Per RFI P1-0063 response, "Detail 2/A1-9228 has been updated. Detail reference 4/A-0026 SIM has been removed. Refer to the attached SKA-3667."

The revised detail shows an embedded plate at the B.O. Lower Concourse Deck. No information is provided for the embeded plate. Please provide information on embedded plate.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

P1-0064	Continuous Seal at Interior Side of Exterior Concrete Wall	Closed	06/09/2014	06/19/2014	06/30/2014	Potentially	☐

From: Webcor Construction LP Scott Shope **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 4/A1-9211

Detail 4/A1-9211 shows a continuous seal between the structural steel, and the interior side of the exterior concrete wall. Is cont. seal required at the int. side of ext. wall? If so, please provide detail.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. On the exterior side of concrete wall/topping slab ¿ Separation is required between concrete wall and topping slab, which will consists of typical sealant/compressible material joint fill.

2. On the interior side of concrete wall/column base plate ¿ Physical Separation between column plate and concrete wall is still required, but sealant is not necessary.

Co-Author:

REQUEST:

Reference: 2/L1-7317

Detail indicates that the architect and structural engineer are to confirm the detail. A1-8717 refers back to Landscape, and structural does not appear to address the issue. Please coordinate landscape, architectural and structural.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

TT Response:

The gantry equipment is to be supported by concrete blocks over the concrete MFB beams. See attached sketch SKS-0360 for concrete block details at the gantry supports. These details will be added to the structural drawings in a future ASI.

PWP Response:

1. The concrete block (by structural) which is exposed to the sidewalk should be specified as integral color to match landscape cast in place concrete. Refer to attached SKLA-304.

2. TT¿s sketch SKS-0360 reflects a notch in the concrete block at manhole covers. It should be clarified that in order to avoid cracking and failure of the paving at the notch, that the notch in concrete to occur adjacent to metal lined frame of lift out lids. Metal frame and tray by others. Refer to attached SKLA-304.

AAI Response:

Gantry support concrete blocks are not a part of TG07.2 except for cast-in dowels as identified by structure. Refer to attached sketches SKA-3694, SKA-3700, SKA-3701 and SKA-3702.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0080.1	Concrete Block Placement for Gantry Crane Support at Transformer Vaults	Closed	07/18/2014	07/28/2014	08/05/2014	Potentially	☐

P1-0083	PVC Roofing Substrate Requirement	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	☐

From: Webcor Construction LP Scott Shope **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: Specification Section 07 54 19 3.2A

07 54 19 3.2A requires "the general contractor shall examine substrates, areas, and conditions" with the installer for compliance with the contract documents. Please remove the requirement for the general contractor to verify existing conditions with subcontractor. Subcontractor is solely responsible to verify and accept existing conditions prior to commencing work.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Contract Documents refer to the Contractor defined as the General Contractor/Construction Manager (CMGC) in the TJPA/CMGC Agreement for responsibility to complete the Work and for coordination of the Work, not to individual subcontractors that are contracted to the CMGC. The specification is correct.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0083.1	Additional Review of PVC Substrate Requirement	Closed	07/01/2014	07/11/2014	09/01/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Transbay PMPC Ray Quesada

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0083, Specification Section 07 54 19 3.2A

As stated in RFI Response P1-0083, "The Contract Documents refer to the Contractor defined as the General Contractor/Construction Manager (CMGC) in the TJPA/CMGC Agreement for responsibility to complete the Work and for coordination of the Work, not to individual subcontractors that are contracted to the CMGC. The specification is correct."

Per the contract, the CMGC verifies compliance of the work with the contract documents via the QA/QC process at the time of installation. Additional review of the work to reverify conformance with the contract documents as set forth in Specification Section 07 54 19 3.2A is an added service. Please confirm TJPA intends to have this added service to CM/GC's contract incorporated into the work.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The TJPA does not agree that what is required in this specification section is an added service. The CM/GC is ultimately responsible for the quality of the entire project. If the CM/GC wishes to assign or delegate any responsibility to a subcontractor related to quality control, that is your prerogative.

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0097, Specification Section 10 51 13

As stated in RFI Response P1-0097, "As per specification section 10 51 13, benches are manufactured product and need to be installed/anchored in accordance with manufacturer's standard details. There is a basis for design product in the specification. However, through the bidding process this may not be the product that is provided on the Project. The specification calls for the benches to be bolted to floor with galvanized expansion fasteners."

RFI Response P1-0097.1 indicates that the bench is to be anchored per the manufacturer's standard details, then goes on to require bolting to the floor with galvanized expansion fasteners. Please clarify whether the manufacturer's details are to be used or galvaninzed expansion anchors.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Per Specification Section 10 51 13 / 2.5, benches shall be "bolted to the floor with galvanized expansion fasteners." However, if the manufacturer or Contractor recommend an alternate attachment detail, the CMGC shall submit an RFI with information on the alternate proposed fastening method for the TJPA Representative's review and comment. In addition, on the bench side of the bolt, the bench manufacturer shall provide for fastening of the bench to the floor.

ANSWER: **Accept Suggestion:** ☐
The elevator shafts interiors shall be painted.

P1-0099.1 **Finish Level Clarification for Painted Interior Shaft Walls** **Closed** **07/02/2014** **07/12/2014** **07/11/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:
REFERENCE: RFI Response P1-0099, Detail 1/A1-7575, Specification Section 09 21 16 3.7 F 2

As stated in RFI Response P1-0099, "The elevator shafts interiors shall be painted."

Specification Section 09 21 16 3.7 F 2 states that the interior faces of the shafts are to be a Level 1 finish. Per RFI Response P1-0099, the interiors of all elevator shafts are to be painted. It is not industry standard to paint a Level 1 finish. Please confirm that a Level 1 finish is to be used as a paintable surface within the elevator shafts, and provide a paint finish standard for this work (typically, a min. Level 3 finish is used for painted surfaces, and the industry standard finish requirements are based upon the drywall finish level).

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐
Confirmed, we want a paint finish in the elevator shaft on the least expensive drywall finish possible (level 1). The paint is being utilized to enhance the durability of the materials in the elevator shaft. WOJV should inform the design team if there is a constructability issue here, or if paint on a level 1 drywall finish is just not pretty.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0099.2	Level 1 Paint Finish Requirements	Closed	07/15/2014	07/25/2014	08/05/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0099.1, GA-214-10

RFI Response P1-0099.1 confirms a Level 1 finish is to be furnished, installed and painted on the interior of the elevator shafts, however does not provide the requested paint finish requirements.

Per industry standard (see attached GA-214-10), Level 1 finish includes embedment of tape in joint compound, but tape and fastener heads need not be covered with joint compound. Per 09 91 00 3.2 I, joints and screw heads are to be covered with joint compound and sanded smooth and flush with adjacent surfaces (i.e. a higher finish level than Level 1).

Please provide the requested paint finish requirements referenced in RFI P1-0099.1.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Gypsum Board Finish ¿ In the elevator shafts, provide Level 3 finish.

Paint Finish requirements shall be as specified in section 09 91 00 (Painting) item 3.2.I.

Paint shall be per products specified in Paint Finish Schedule for exterior surfaces (for Portland Cement Plaster, . . .) 100 percent Acrylic Flat - Refer to section 09 91 00, item 3.7.A.

Color to be selected in the future.

REQUEST:

REFERENCE: Detail 1/S1-2252 (Attached), Detail 10/S1-9001, Details 2 & 3/A1-9229, Sheet A1-8662 Fire Protection Matrix & Schedule (All from IFC Drawings for Main Package dated 3/31/14)

Per Detail 1/S1-2252 (Attached), Composite Deck Type S1 extends through the face of the northerly CMU wall, and is supported by this wall (see attached). This condition is shown on Detail 10/S1-9001 (direction to this detail is given on 4/S1-5032).

Details 2 & 3/A1-9229 show this condition as being supported by structural steel framing which does not show on structural drawings and fireproofed which would not be required per Sheet A1-8662 Fire Protection Matrix and Schedule. Please coordinate architectural and structural drawings to match.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

TT Response:

For the exit passageway composite deck structural steel framing, refer to response to RFI P1-0103. Updated detail 10 of S1-9001 was issued with ASI-0121.

AAI Response:

Fireproofing is required for the exit passageway composite deck structural steel framing, beams, and hangers. Refer to attached SKA-3905. Refer also to A1-9229 and A1-9230 issued with ASI-0121.

Co-Author:

REQUEST:

reference: 07 54 19 2.2A

07 54 19 2.2A specifies only Sika Sarafil Waterproofing systems, or substitute products of another manufacturer for RF-1. Webcor intends to require all manufactures be approved via QBD prior to bid. If this is not acceptable, please provide specific manufacturers and products which are acceptable to use.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40 is the process to be utilized for Bidder proposed substitutions to the Basis of Design. In the Substitution Request, the bidder shall provide the information that outlines how the product is equivalent for the JPA representative's review. The QBD process is not the correct process, because it will leave the burden for researching how the product is equivalent on the TJPA team rather than the bidder and manufacture who are the experts on their proposed products.

P1-0108.1	Product/Manufacturer Substitution for PVC Roofing	Closed	07/31/2014	08/10/2014	08/05/2014	Potentially	☐

Co-Author:

REQUEST:

Reference: A1-8881, A1-8717 & A1-8710

2/A1-8710, 5/A1-8717 and 3/A1-8881 requires 1" steel plate under roadways and curbs below roadways. A1-2922 through A1-2927 omit a significant amount of plate shown on Beale, Fremont, First, Minna, and Natoma Streets by the details. Please revise the details or plan sheets to agree with each other.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Protection slab sheets have been revised to match details. Note that the details are typical and the protection slab drawings show extents of steel plate at ground level. Refer to SKA-3699 for typical waterproofing note at roadway to train box lid and sketches SKA-3693, 3695, 3696, 3697, and 3698.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0114.1	Metal Plate Omissions for Ground Level Protection Slab	Closed	07/18/2014	07/28/2014	08/20/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
RFI Response P1-0114
Sketch SKA-3693
Sketch SKA-3695
Sketch SKA-3696
Sketch SKA-3697
Sketch SKA-3698
Detail 2/SKA-3538 (ASI 119 dated 6/20/14)

Per RFI Response P1-0114:
1. Sketch SKA-3693 does not show metal plates at the following Gridelines: C/2 and G/4.
2. Sketch SKA-3695 does not show metal plates at the following Gridelines: G/9.9, G/10.1, G/12, and F/9.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1) Correct, metal plates are not required at locations noted, only concrete protection slab as indicated on SKA-3693.

2) Correct, metal plates are not required at locations noted, only concrete protection slab as indicated on SKA-3695.

3) Correct, metal plate is not required at locations noted, only concrete protection slab as indicated on SKA-3696.

4) Correct, metal plates are not required at locations noted - these are interior locations,

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

3. Sketch SKA-3696 does not show a metal plate at Grideline G/16
4. Sketch SKA-3697 does not show metal plates at the following Gridlines: D/19.9, D/20.1, D/21, D22, D24, F/19.9, F/20.1, F/21, F/22, and F/24
5. Sketch SKA-3698 does not show metal plates at any location.

However, Sketches SKA-3693, SKA-3695, SKA-3696, and SKA-3697 show metal plates are to be installed at signigicant amounts of similar conditions.

Please note Detail 2/SKA-3538 of ASI 119 shows metal plates at GL G/10.1 but steel plates are omitted on Sketch-3695 at this location

Please confirm that only locations identified as having metal plates on Sketches SKA-3693, SKA-3695, SKA-3696, and SKA-3697 require metal plates.

Protection Slab plans refer to perimeter and exterior conditions only.

5) Incorrect - SKA-3698 shows a metal plate all along GL 34.8 and 35, from A through J.

Note: Details are typical and protection slab drawings show extent of metal plate and concrete protection slab at the ground level based on depth of landscape finishes or roadways. Locations as identified on the sketches noted indicate where metal protection plates are required.

P1-0115 **Electrical Continuity and Grounding** **Closed** **06/11/2014** **06/21/2014** **07/11/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 05 50 00

05 50 00 1.1 A4 indicates that electrical continuity and grounding for metal fabrications is included in 05 50 00, but give no further information on what is required. Please confirm no grounding of metal fabrications is required, or provide the grounding requirements.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Grounding of metal fabrications is required for systems as follows:

1) System includes internal elements that require bonding (such as the dispenser bollards). Refer to product installation requirements.

2) System includes equipment which are called out to be bonded on the drawings (i.e. metal in the utility vaults). Refer to notes on the drawings.

3) Bonding is required by code to a specific application/use. Bond in accordance with applicable codes.

Reference: A1-9375

The W-13 glass light sculpture is shown on detail 1/A1-9375. Is this light sculpture to be deleted from the drawings or will it be part of our scope of work?

Laminated glass is shown on detail 2/A1-9375. Is this laminated glass to be deleted from the drawings or will it be part of our scope of work?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The light sculpture and all of its component parts, as shown on A1-9375 and W-13 system drawings and specifications, have NOT been deleted and remain part of the work.

P1-0121	Mock-up Locations in A Drawings	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 08 88 53

Provide location in Architectural drawings for extent of mock-ups. Section 1.9.O does not list a valid location for extent. Section 1.9.O shows 084426A references for mock-up extent.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

For W-12 mock-up, see 2/A1-8451. For W-13 mock-up, see 1/A1-8476.

The question is noted in the attachment, but not included above.

P1-0122	Contractor's Proprietary System Language for Glass Floors	Closed	06/11/2014	06/21/2014	07/01/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 08 88 53 and 08 44 33 (TG08.2/TG08.10 - Design/Build Glazing Systems dated 5/16/2014)

Add design build language similar to that of 08 44 33 Section 1.1.A.25 to allow for contractor's proprietary system.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Design Build language extracted from Spec Section 08 44 33 paragraph 1.1.A.25 has been added to Spec Section 08 88 53 paragraph 1.1.A.21 and will be issued in the forthcoming ASI for the VE round of Design Build package submission.

P1-0123	Location of Bearing Supports	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 8/S1-6010, 1 and 2/S1-6020

Confirm location of the bearing supports. The table on 8/S1-6010 and details 1 and 2/S1-6020 do not match. Clarify.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The location of the bearing supports is clearly indicated on the drawings. We have updated the details 1 and 2 to add missing information. If there is any specific information missing, please let us know.

P1-0123.1	Updated Detail for Bearing Plate	Closed	07/03/2014	07/13/2014	07/11/2014	Potentially	☐

P1-0126	Horizontal Life Line Stanchion	Closed	06/11/2014	06/21/2014	06/30/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 1 and 2/WW1-5001 and 4/A1-8860

Details 1 and 2/WW1-5001 shows typical details for a prefabricated horizontal life line support however Architectural floor plans refer to 4/A1-8860 for typical horizontal life line stanchion detail.

1. Clarify which stanchion is to be used to support the horizontal life line system

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Detail 1/WW1-5001 shows the life line condition, detail 2 is for standalone point tie-back. Please note that the ends of the life line assembly are the same as the tie-back.

2. Refer to structural for structural connections, not architectural or façade maintenance, if an additional detail is required please indicate.

3. Detail 4/A1-8860 indicates typical waterproofing.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

2. Clarify the means of connection to the WF beam. Detail 4/A1-8860 shows a bolted connection and 1/WW1-5001 calls for a welded connection.

3. Provide waterproofing and flashing details for the stanchion.

P1-0126.1 **Fall Arrest Stanchions.** **Closed** **08/05/2014** **08/15/2014** **08/20/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference 2/WW1-5001 and 4/A1-8860

Per response to RFI P1-0126 detail 4/A1-8860 is to be used for typical waterproofing. Detail 4 shows the fall arrest stanchion waterproofed on top and both sides with flashing. Should the fall arrest stanchion be completely flashed it may get damaged due to use of lanyard creating an entry point for water intrusion. Please confirm the fall arrest stanchions should have flashing on all sides

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed, the fall arrest stanchions should have flashing on all sides.

P1-0127 **Davit Base Plate Connection** **Closed** **06/11/2014** **06/21/2014** **06/24/2014** **Potentially** ☐

Co-Author:

REQUEST:

Reference: 07 81 00 3.1.B, A1-8662, A1-8663

Per the attached letter, Skanska will furnish and install Carboline Protective Coatings Primer on all steel to receive Intumescent Fireproofing. Bidders will be directed to assume the steel will be received with this coating, and they will use compatible coatings, or perform all necessary surface prep to use a different system.

Per 07 81 00 3.1 B fireproofing cannot begin prior to completion of roofing. This will not work with the construction schedule. Please confirm that FP-1 and RFLE do not exist, or provide spec and location (see A1-8662 & A1-8663)

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The construction schedule and sequence of construction is the responsibility of the CM/GC.

FP-1 and RFLE-3 indicated in the fireproofing Schedule of Sheet A1-8662 are clearly indicated in the description column of the schedule. FP-1 is a fireproofing method covered in RFLE#3 document approved by SFFD/DBI . RFLE-3 is a method of calculation also covered in RFLE#3 document also approved by SFFD/DBI.

P1-0131	Fire Blankets Shown at Ceiling Locations	Closed	06/11/2014	06/21/2014	06/30/2014	Potentially	☐

From: Webcor Construction LP Scott Shope **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: A1-8890, 07 09 13

The contract documents show fire blankets within the ceiling space at several locations. Are these part of the rated seismic joint assemblies? The seismic joint assemblies note that the assembly must have a "fire barrier", but does not identify the barrier as a "fire blanket." If the "fire blanket" is the "fire barrier" identified in 07 09 13, please remove/revise the language on the drawings to match the specification. If this is an added material to be furnished and installed separately, please provide a spec., extent, and details for the fire blanket.

This affects TG16.1 Framing/Drywall and/or TG07.8 Expansion Joints. Please provide the requested information so as not to impact the bidding schedule.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Fire Blanket is part of the seismic joint assembly. The annotation has been revised to match the Specification. Refer To SKA-3692.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0132	Installation Requirements for Insulation	Closed	06/11/2014	06/21/2014	07/02/2014	Potentially	☐

From: Webcor Construction LP Scott Shope **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 09 80 00

1.9 A requires that all materials requiring "wetness, moisture or dampness" be completed prior to installation of insulation. This would mean that all drywall finish, thin set tile, and any other "wet applied" finishes be installed prior to acoustic insulation/sealant being installed within the wall cavities, or penetrations. Please rewrite this requirement to follow the manufacturer's written recommendations.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is a means and methods requirement that the CM/GC shall manage as stated in Division 01. Specification 09 80 00 sets forth the industry standard requirements for installation of the insulation materials an systems. Specification language does not change.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0132.1	Language Revision for Material Installation per Specification Section 09 80 00	Closed	07/09/2014	07/19/2014	08/27/2014	Potentially	☐

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0132, Specification

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification language on Section 09 80 00 / 1.9 A will

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Section 09 80 00

As stated in RFI Response P1-0132, "This is a means and methods requirement that the CM/GC shall manage as stated in Division 01. Specification 09 80 00 sets forth the industry standard requirements for installation of the insulation materials an systems. Specification language does not change."

RFI Response 0132 requires that insulation not be installed unless no further installation of materials requiring wetness, moisture or dampness is contemplated. Drywall mud, thin set for tile, terrazzo, paint and other finish materials create wetness, moisture, and damp condition within the building. Please revise the language to mandate material specified within Specification Section 09 80 00 shall be installed per the manufactuer's written installation instructions.

be revised as recommended in this RFI. This revision will be included in ASI 127.

P1-0133 **Relative Humidity Requirement** **Closed** **06/11/2014** **06/21/2014** **07/02/2014** **Potentially** ☐

From: Webcor Construction LP Scott Shope **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 09 80 00

1.9 B requires that relative humidity in the area of work does not exceed 55% humidity for the duration of the project. The average relative humidity for San Francisco is above 55% for +80% of the year (and those days below 55% are intermixed between days above 55%). By this standard, we would need to scaffold, shrink wrap, rent air conditioners/dehumidifiers and run them for several years until substantial completion. Please rewrite this requirement to follow the manufacturer's written recommendations.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 09 80 00 1.9 B shall be revised to state: "Ensure manufacturer's written installation requirements for ambient conditions are met."

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0134	Embeds for Superintendent Station	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	☐

From: Webcor Construction LP Scott Shope **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: A1-8181

Per A1-8181, there are embeds within the curbs at the Superintendent Station at the bus deck level. The design of these embeds is not indicated. Please provide the size, location (i.e. continuous, etc.), and method of embedment (1/2" welded studs at 24" o.c.). This will impact TG07.3. Please provide the requested information so as not to impact the bidding schedule.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The embeds for the Bus Deck Superintendent's Station shown on sheet A1-8181 are not required. Sheet A1-8181 has been omitted in TG08.10. The Bus Deck Superintendent's Station will be a pre-fabricated booth per VE mitigation meetings. Documentation for pre-fabricated booths to be issued in a future package.

P1-0134.1	Required Detailing for Superintendent's Station Concrete Platform	Closed	07/03/2014	07/13/2014	07/22/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0134

As stated in RFI Response P1-0134, "The embeds for the Bus Deck Superintendent's Station shown on sheet A1-8181 are not required. Sheet A1-8181 has been omitted in TG08.10. The Bus Deck Superintendent's Station will be a pre-fabricated booth per VE mitigation meetings. Documentation for pre-fabricated booths to be issued in a future package."

Per RFI Response P1-0134, detailing for the Superintendent's Station will be provided in a future package. The information related to the concrete platform is required to aquire pricing for topping slabs. Please provide the detailing for the Superintendent's Station Concrete Platform.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This information will be provided with the ASI that will be issued on the schedule agreed to with WOJV and TGPA. Design of the concrete platform cannot be completed without completing the redesign of the Superintendent's Station per the TJPA directed design change.

P1-0135	Below Grade Waterproofing	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

reference: 07 13 54

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Product data is not attached as noted in the question.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Per the contract documents, WPM-3 is to be used at the roof park level below grade. Per 07 13 54, WPM-3 is Sika Sarnafil Waterproofing System PVC G476-20. Per the product data for Sarnafil PVC G476 (see attached), WPM-3 can be exposed for a maximum of 3 months. Based upon this limitation Webcor will be requiring the waterproofing subcontractor to protect the waterproofing until permanent overburden (foam fill, soil, rock, etc.) can be installed. This may lead to substantial added cost to the project. Please confirm that this is acceptable, or revise the contract documents to a product which can be exposed for an extended duration.

See Application specification section 07 13 54 / 3.3 that states "The waterproofing sequence in general shall be as follows: install the first ply of the membrane to serve as temporary waterproofing until the building is ready to receive the overburden at Park level. Following installation of ..... Additional protection in areas where construction will occur above the membrane will be installed and removed by other contractors."

The Contractor is responsible for means and methods of construction and scheduling the interaction of trades to complete the work. The contractor shall determine the most cost effective means of water management during construction to reduce project costs. The suggested construction phase water management process outlined in specification section 07 13 54 can be altered as desired by the Contractor to reduce costs and coordinate with the Contractor's means and methods. The completed waterproofing system, testing, etc. shall comply with 07 13 54 and the drawings in the Contract Documents (e.g. waterproofing detail 7/A1-8851).

P1-0136	Roofing Spec	Closed	06/11/2014	06/21/2014	07/02/2014	Potentially ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

reference: 07 13 54 1.8 A 2

Per 07 13 54 1.8 A 2, the roofing subcontractor must be prepared to cover unfinished work with temporary covers in the event of an unexpected rainfall. Per 07 13 54 1.8 B, the roofing subcontractor must leave the building in a completely watertight condition at the end of each day, and make unfinished work watertight. Based upon these requirements, Webcor will be requiring the roofing subcontractor to protect the entire area of the roof until it is completely watertight. This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The referenced specification section 07 13 54 / 1.8.A2 states "Be prepared to cover unfinished work with temporary covers in the event of an unexpected rainfall." The statement does not state that the entire area of the roof shall be covered every night. This is required to prevent damage to the incomplete ongoing waterproofing work, which might result from issues such as water entrapment within the system.

Specification section 07 13 54 / 1.8 B will be revised in a future ASI to delete the requirement that "At the end of each day, leave the building in a completely watertight condition." WOJV has bid manual

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

instructions that appropriately describe the CM/GC requirements on this issue.

P1-0137 **Waterproofing Membrane Curing time** **Closed** **06/11/2014** **06/21/2014** **07/02/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: 07 13 00 3.5 A

Spec Section 07 13 00 3.5 A 1 requires the waterproofing membrane to cure a minimum of 7 days at 70 degrees Fahrenheit. In San Francisco, the average daily high temperature does not get up to 70 degrees for 8 months out of the year, and the average low temperature is below 70 degrees year round. As such, acclimatization (scaffold, tenting, and heaters) will be required to maintain the 70 degrees the entire duration of the W/P activity. This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The language has been revised. Refer to attached SKLA-306.

P1-0138 **Unfinished work watertight spec** **Closed** **06/11/2014** **06/21/2014** **07/02/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

07 14 13 1.8 B

Spec Section 07 14 13 1.8 B requires "at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." This requirement will require the tenting of the entire building in order to make the building and unfinished work "watertight." This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Spec Section 07 14 13 / 1.8 B shall be deleted.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0139	Unfinished work watertight spec	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

reference: 07 54 19 1.9 A 5

Spec Section 07 54 19 1.9 A 5 requires "at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." This requirement will require the tenting of the entire building in order to make the building and unfinished work "watertight." This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The following sentence; "...at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." Will be deleted from Spec Section 07 54 19 1.9 A 5. You are correct, construction phase weather protection is a means and methods issue.

WOJV shall review this changed specification in relation to the Bid Manual and adjust the Bid Manual as required. The Bid Manual previously stated: "It shall be the responsibility of the Trade Subcontractor to take all measures to protect Work from inclement weather, including that determined by WOJV, until completion of the work and acceptance by the Owner." and "In the event that the building requires weather protection and rain water control, Trade Subcontractor shall furnish and install all weather protection as required for Work to continue unabated and will be liable for damage to other Work or costs for weather protection installation due to Trade Subcontractor's failure to timely or properly install weather protection." We also don't believe your text is intended to require each individual trade subcontractor to fully tent the building each day or even on a rainy day.

As stated in RFI Response P1-00139, "The following sentence; "...at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." Will be deleted from Spec Section 07 54 19 1.9 A 5. You are correct, construction phase weather protection is a means and methods issue.

WOJV shall review this changed specification in relation to the Bid Manual and adjust the Bid Manual as required. The Bid Manual previously stated: "It shall be the

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

responsibility of the Trade Subcontractor to take all measures to protect Work from inclement weather, including that determined by WOJV, until completion of the work and acceptance by the Owner." and "In the event that the building requires weather protection and rain water control, Trade Subcontractor shall furnish and install all weather protection as required for Work to continue unabated and will be liable for damage to other Work or costs for weather protection installation due to Trade Subcontractor's failure to timely or properly install weather protection." We also don't believe your text is intended to require each individual trade subcontractor to fully tent the building each day or even on a rainy day."

RFI Response P1-00139 indicates that Specification Section 07 54 19 1.9 A 5 will be changed. No specification or specific direction to delete the language was provided. Please provide the revised language or direct the language to be stricken for Specification Section 07 54 19 1.9 A 5.

P1-0140 **Floor Coating Temperature Spec** **Closed** **06/11/2014** **06/21/2014** **07/22/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

reference: 07 18 14 1.8 B

Spec Section 07 18 14 1.8 B indicates ¿ambient and surface temperatures shall be at least 60 degrees F for a minimum period of 48 hours before, during and after coating system application.¿ I would suggest language requiring environmental conditions be established as required by the product manufacturer. Otherwise, this may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The requirement of Spec Section 07 18 14 1.8 B shall be revised to: "Ambient and surface temperatures shall be maintained per manufacturer's requirements for the application of floor coatings."

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0141	Coating Requirements	Closed	06/11/2014	06/21/2014	07/02/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 07 18 14 3.6 A

Spec Section 07 18 14 3.6 A indicates "Ambient and surface temperatures shall be at least 50 degrees F for a minimum period of 48 hours before, during and after coating system application." This conflicts with 07 18 14 1.8 B. In addition, I would suggest language requiring environmental conditions be established as required by the product manufacturer. This may reduce acclimatization, and conflicts with the manufacturer's installation instructions. Otherwise, this may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Ambient and surface temperatures shall be maintained per manufacturer's requirements for the application of floor coatings.

04 20 00 3.7 A requires that prior to placing CMU, the aggregate within the concrete base is to be exposed. This may expose rebar within slabs/concrete curbs, require touch-up of adj. surfaces, and require additional protection of adj. surfaces. Please confirm that concrete material is

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification 04 20 00 / 3.7A requires the contractor to clean the top of concrete, remove laitance and expose aggregate; not to expose the rebar. This is an industry standard for installing masonry and should not require additional protection on properly placed concrete elements.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

to be removed to expose aggregate within the concrete base below CMU walls.

P1-0147 **Concrete Curbs at CMU Walls** **Closed** **06/13/2014** **06/23/2014** **06/24/2014** **Potentially** ☐

From: Webcor Construction LP Scott Shope **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 4/A1-0022

4/A1-0022 indicates that a "CC" accompanies the CMU wall symbol if a concrete curb is to be erected below the wall. 1/A-0025 indicates that typical CMU walls do not have curbs. 2/A-0025 indicates that if a CMU wall is on a sloped slab, a curb is typically required below the CMU wall. Enlarged floor plans in architectural plans do not typically show a concrete curb below CMU walls (i.e. no "CC" adj. to the symbol). Typical structural details (1 & 2/S1-9001) show concrete curbs at all CMU walls. Are all CMU walls supposed to receive concrete curbs or only the ones identified on architectural plans?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Not all CMU walls have concrete curbs. The CMU walls that have a concrete curb have annotation ¿CC¿ specified on their wall tag. These walls, with their wall tags, have been illustrated on the architectural zone plans.

S1-9001 illustrates curbs for CMU walls, where they exist.

From: Webcor Construction LP Scott Shope **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 3 & 4/A-0024

Per 3 & 4/A-0024 within the train box there are 2 different wall joint details depending if the wall is running north and south, or east and west. The details go on to reference structural for wall control joint information in each direction. Per S1-9000 - S1-9003 (Typical CMU Details) there is one standard detail for all construction joints. Please confirm there is only one construction joint detail desired for walls running in any direction, and coordinate arch. drawings to match.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This question is vague and cannot be answered. Joint widths vary along the E/W length of the building as well as vertically by level. Contractor to provide information on the joints in question by both gridlines (N/S & E/W) as well as building level (Platform, Lower Concourse etc.).

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0149.1	Widths for Below Grade/Train Box CMU Control Joints	Closed	07/03/2014	07/13/2014	08/05/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0149, Details 3 & 4/A-0024, Details 7 & 10/S1-9000

As stated in RFI Response P1-0149, "This question is vague and cannot be answered. Joint widths vary along the E/W length of the building as well as vertically by level. Contractor to provide information on the joints in question by both gridlines (N/S & E/W) as well as building level (Platform, Lower Concourse etc.)"

- Per Detail 3/A-0024 the train box CMU control joints running in an east to west direction appears to be the width of a standard grout joint.
- Per Detail 4/A-0024 the train box CMU control joints running in a north to south direction are larger than the width of a standard grout joint.
- Details 3 & 4/A-0024 indicate that structural drawings are to be referenced for control joint information.
- Per Details 7 & 10/S1-9000 standard below grade CMU wall control joints are 3/8" reguardless of orientation.

Please confirm that all below grade/train box CMU wall control joints are to be 3/8" wide as required by structural, rather than differing widths based upon orientation as indicated on the architectural drawings.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Joints laid out in the architectural drawings reduce continuous wall lengths for the purpose of crack control and/or permit the seismic displacement of elements braced to the floor above relative to those elements that are permitted to slip relative the floor above.

For joints oriented in the north-south direction, control and seismic functions are satisfied at a joint width of 3/8¿. This is due to the small magnitude of below grade seismic building drift in the east-west direction.

Joints oriented in the east-west direction for the purpose of providing seismic separation under north-south building drift shall be sized per General Note CD-6 of S-0005, requiring Operational Performance under GSL-2 Earthquake. The GSL-2 story drifts that control the joint widths are tabulated on S-0006. For partition walls at the Train Platform Level, the Lower Concourse drift demands apply. For partition walls at the Lower Concourse, the Ground Level drift demands apply. Drift demands are converted to displacements (joint sizes) by multiplying the percentage drift by the story height.

P1-0156	Openings around Ground Level Columns	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

reference: A1-2104

Per the architectural slab plans (see below for example) there are openings around the ground level columns with galvanized steel plate supporting the slab above. Structural drawings (see below for example) does not show these openings. Are these openings required? Please revise the documents to conform with each other.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The openings around the ground level columns, are block outs for the base plate. For locations and dimensions of these openings, refer to the architectural slab edge plans. Structural drawing A1-5052 illustrates the base plate detail and dimensions.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0157	Base Plate Detail at Ground Level	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	☐

Co-Author:

REQUEST:

reference: S-2063, S1-2502, A1-2502

Per the Bus Ramp Drawing S-2063, the elevation at T.O. AC is 56.10 (56' - 1-3/16") where the bridge connects to the transit center. Per S1-2502 T.O. Steel at H line (1' - 7" away from the bus bridge connection) is 56' - 4" (2-13/16" higher than the bus ramp AC). Per A1-2502, drive aisle high point along GL-H is 57' - 11-1/4" (1' - 10-1/16" higher than the T.O. Bus Bridge AC). Please review the grades at this location to confirm the bus bridge aligns with the top of bus deck.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Per S1-2502, 56'-4" top of steel elevation at GL-H is correct. Per A1-2502, 57'-11 1/4" drive aisle high point along GL-H is correct.

P1-0159.1 **Revision to Detail 2/A1-8378 to Match RFI Responses** **Closed** **07/08/2014** **07/18/2014** **07/22/2014** **Potentially** ☐

REQUEST:

reference: A1-2502

The accessible path of travel to the Bus Deck Superintendent Station appears to be missing some ramp rails (I believe over 5% slope requires rails)

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Ramp rails information can be found on A1-8168 and A1-8169. However, sheets A1-8168 and A1-8169 have been omitted in TG08.10. Bus Deck Superintendent's Station will be a pre-fabricated booth per VE mitigation meetings. Documentation for pre-

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

fabricated booths to be issued in a future package.

P1-0165.1 **Rail Requirements for the Path of Travel to the Superintendent Station** **Closed** **07/25/2014** **08/04/2014** **09/03/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0165, Sheet A1-8168, Sheet A1-8169, CBC Section 1003.5, CBC Section 1010.19

As stated in RFI Response P1-0165, "Ramp rails information can be found on A1-8168 and A1-8169. However, sheets A1-8168 and A1-8169 have been omitted in TG08.10. Bus Deck Superintendent's Station will be a pre-fabricated booth per VE mitigation meetings. Documentation for pre-fabricated booths to be issued in a future package."

A1-8168 and A1-8169 show rails for the ramp west of the superintendent station, but omits rails at the 8.1% ramp/curb cut south of the superintendent station and across the drive aisle from it.

- Per CBC Section 1003.5, slopes along the path of egress which exceed 5% must comply with CBC Section 1010.

- Per CBC Section 1010.9 requires ramps with a rise greater than 6" to have handrails on both sides.

- Per CBC Section 1003.5 contrasting finish surfaces in lieu of handrails are only acceptable where the difference in elevation is 6" or less (in this case the vertical travel is appox. 9").

Please confirm that portions of the path of travel to the Superintendent Station which exceed 5%, and have a vertical travel greater than 6" do not require rails.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Refer to attached sketches SKA-4044, SKA-4046 and SKA-4047 for updated layout of ramps with required rails.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

issued in a future package."

RFI Response P1-0166 indicates that documentation for pre-fabricated booths will be issued in a future package. The work around the pre-fabricated booths is not included in the same bid package as the pre-fabricated booth. Please provide the information regarding structures supporting the pre-fabricated booths.

P1-0169 **Coating for Metal Surfaces** **Closed** **06/09/2014** **06/19/2014** **06/24/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 05 15 21

Per 05 15 21 Steel Castings (see attached), steel castings (most notably the cast nodes) are to be furnished as bare metal. This was confirmed in the construction issues meeting held on 04/17/14 (see attached), with the indication that coating of the bare metal is to be included in TG16.5 Painting. 09 97 16 High Performance Coatings - Superstructure Package (see attached) identifies a coating system for exterior exposed factory-primed metal surfaces, and a coating system for galvanized steel, but not a coating system for exterior exposed unprimed/non-galvanized metal surfaces. Please provide the coating system for all unprimed/non-galvanized metal surfaces.

Revised: IFC Set 09 97 15 2.5 B calls out for "Shop Primer" in the "Coating System for Exposed Unprimed and Non-Galvanized Steel Surfaces." Based on this information the painter (who in not under contract yet) would need to go to the steel erector's shop to prime the steel (which is currently in production) with the materials called out in 05 10 00 and 05 12 13. Based on the current schedule, the unprimed/non-galvanized steel will be erected before the painter is under contract. In addition, adding priming of these surfaces to the steel scope of work would negatively impact the delivery and erection schedule of steel. Please revise the spec to provide priming of unprimed and non-galvanized metal in the field,

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Per specification section 09 97 16, part 1, 1.1, A.1; all AESS are to receive high performance coatings. Per specification section 05 10 00 part 2, 2.2, A and 2.2, C indicate all structural steel is to be either primed of galvanized; there is no exception for the cast steel items. Shop Primer is required as specified.

The specifications are intended to be read as a whole and as such, specification section 05 15 21 only speaks to the fabrication of steel castings, a sub-set of structural steel which is governed by section 05 10 00.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

or confirm that it is acceptable for steel erection to be delayed.

P1-0169.1 **Clarification for the Preparation of Cast Nodes** **Closed** **07/08/2014** **07/18/2014** **08/20/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: (All Attached)
- RFI Response P1-0169
- Specification Section 05 10 00 (IFC Drawings for Main Package dated 3/31/14)
- Sheet S1-1023
- Submittal TG0701-99C.1

Per RFI Response P1-0169 (Attached), cast nodes are governed by Specification Section 05 10 00 (Attached), and shall be shop primed.

- Per Specification Section 05 10 00 3.2 P 1 (See attached Specification Section 05 10 00), "Unless otherwise specified in Section 3.2.P.3, shop prime all structural steel..."
- Per Specification Section 05 10 00 3.2 P 3 d (See attached Specification Section 05 10 00), "Surfaces requiring preheat are not to be primed until preheat has been performed."
- Per structural drawings (Example Sheet S1-1023 attached) cast nodes are to be field welded to the adjacent tube columns.

In order to weld the cast nodes to the adjacent tube columns, the cast node must be preheated as confirmed in the reviewed welding procedure from Submittal TG0701-99C.1 (Attached). Since surfaces to be preheated are not to be shop primed, base contract documents explicitly mandate that cast nodes are not to be primed until after welded in the field.

Please confirm TJPA intends to add shop priming of cast

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

WOJV, Turner, and TJPA shall address the questions related to scope of work in the current construction Contract.

The cast nodes are to exhibit a final finish that is completely primed when the welding, grinding and installation is complete with no schedule or cost impacts. The finish is to adhere to the final finish standards for the cast nodes that were established during a series of meetings between the Design Team and Bradken, less the shop prime coat.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

nodes (Note: Adding shop priming of cast nodes will negatively impact the budget and schedule). If the addition of shop priming is not desired, please provide a specification for the field priming of unprimed and non-galvanized metal as requested in RFI P1-0169 (See attached RFI Response P1-0169).

1.8.C - Clarify why the warranty is expected to cover defects in design. Shouldn't this be covered under the design team? This is not a design build scope.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Specification Section 11 13 00 "Truck Dock Equipment" / 1.8.C is a warranty for the truck Dock Equipment. The "defects in design" statement is refering to the Truck Dock Equipment designed and manufactured by a company such as Advance Lifts noted under possible product manufacturers.

No, the Truck Dock Equipement is not designed by the PCPA design team and should not be covered under the design team.

P1-0188	Top Coat Material and Color	Closed	06/17/2014	06/27/2014	07/11/2014	Potentially	☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: IFC Set 07 81 23 2.4 C

Per IFC Set 07 81 23 2.4 C, the decorative top coat for intumescent paint is as specified in 09 97 15, and the custom color is to be selected by TJPA. There does not appear to be a system for top coating intumescent paint specified in 09 97 15, nor a color shown for the finish. Please specify the top coat material, and color.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification 07 81 23 2.4 C is correct. The topcoat or finish coat of steel members fireproofed per 07 81 23 shall adhere to the paint systems specified on 09 97 15.

The specified epoxy intumescent coating system is compatible with a wide variety of paint system top coats. Additionally, the contractor shall comply with 09 97 15 1.3 B and 2.3 A and 2.3 B.

The colors will be indicated in the drawings in upcoming ASI.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)
Specification Section 07 81 23 2.4 C
Specification Section 09 97 15

Specification Section 07 81 23 2.4 C indicates that the top coat is to be an aliphantic urethane as specified in Specification Section 09 97 15.

Specification Section 09 97 15 does not have a coating system for steel coated in intumescent fireproofing.

Please provide the requested top coat and color.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification section 07 81 23 1.1 C.2 states that the finish coat is to comply with division 09 for the decorative top coat. Specification section 09 97 16 2.3, 2.4 and 2.5 provides the top/finish coat; this is the same coating system for steel elements coated in intumescent fireproofing.

Please refer the enclosed sketches for colors.

P1-0189	Paint Finish Schedule	Closed	06/18/2014	06/28/2014	07/11/2014	Potentially	☐

reference: RFI P1-0194, A/A1-8166

RFI P1-0194 Response: "Revised sheet A1-8166 and Glass Types Specification 08 80 03 to be issued in future TG08.10 ASI."

P1-0194.1: Response to P1-0194 refers to revised details to be issued in a future bid package. The details are required to accurately bid the associated trade package. Please provide the revised details referenced in the RFI response

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

RFI P1-0194 Response is correct - as stated, Sheet A1-8166 and Specification Section 08 80 03 were included in ASI 0120 issued July 11, 2014, so there is absolutely no issue on this regard with the Bidding documentation. This RFI (RFI P1-0194.1) is not valid, as the CM/GC has the current schedule of submission of packages. Turner should void and delete this RFI.

upcoming TG08.10 Issue for Bid Package.

P1-0200 **PVC Detail** **Closed** **06/18/2014** **06/28/2014** **07/11/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 5/A1-8883

Per 5/A1-8883 2 ea. 2" dia. PVC pipes penetrate the train box wall for draining FJC2 at ground level. Per 5/A1-8883, concrete is to be poured tight to the PVC pipe, and no sealant/link seal/waterproofing is shown around the pipes within the wall. This may lead to the PVC pipe breaking at the wall if the concrete shifts, and a point for water intrusion at the train box wall. Please confirm this is the desired detail at this location.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The PVC pipes are provided with flexible couplers that are attached to flexible membrane and SS secondary gutters to allow both the gutter and PVC drains to move if the concrete shifts. Refer to annotations on details 4 and 5 of A1-8883 issued with the Main Package IFC dated March 31, 2014.

These PVC drain pipes receive 2 plies WPM-1A spiral wrap on the outside face of the foundation and SJ concrete end wall to prevent water intrusion. Refer to annotations on details 4 and 5 of A1-8883 issued with the Main Package IFC dated March 31, 2014.

WOJV shall review the details that interface with the Trainbox waterproofing with the WOJV waterproofing system subcontractor/designer (Best/Grace) and submit shop drawings for each waterproofing condition.

P1-0206.1	Design Requirements for Galvanized Metal Plate per Detail 3/A1-8897	Closed	07/23/2014	08/02/2014	08/20/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0206, Detail 3/A1-8897 (IFC Drawings for Main Package dated 3/31/14)

Per RFI Response P1-0206, there is no galv. metal plate noted nor required for the seisimic joint assembly at Roof Park Level (3/A1-8897).

Per Detail 3/A1-8897 (see attached) there is a "galv. metal plate covering fireproofed structural beam" which is not detailed within the documents (it is unknown if it is required for a seismic joint assembly).

Please provide the design requirements (size, extent, attachment, fireproofing, etc.) for the galvanized metal plate covering fireproofed structural beam depicted on Detail 3/A1-8897.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The response to previous RFI (P1-0206) is correct, there is no galv metal plate required at the fireproofed structural beams. Per VE Item #36, the GFRC system will be eliminated. Please see enclosed SKA-3818R1 and ASK-3963 with revised Roof Park and Bus Deck level fascia drawings, including the seismic joint details.

Co-Author:

REQUEST:

REFERENCE: Specification 07 81 23 3.7 B (IFC Drawings for Main Package dated 3/31/14)

Per Specification 07 81 23 3.7 B, the subcontractor is to "repair areas cut-out or damaged as result of testing. Make repair area invisible under normal lighting conditions at the site from a distance of 2 feet." This requirement may exceed industry standard and result in recoating the entire surface in order to make the required repairs.

Please confirm TJPA intends to have surfaces damaged due to testing entirely recoated to meet the invisibility at 2

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Follow the Contract Document specification.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

feet requirement.

P1-0214 **Request for FJC2 Joint Specification at Ground Level** **Closed** **06/25/2014** **07/05/2014** **07/11/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Drawing A1-8880, Specification 07 09 13 (IFC Drawings for Main Package dated 3/31/14)

Per drawing A1-8880, there are 2 ea. FJC2 expansion joints. One of the FJC2 joints is located at the W-12 exterior glass system (GL 20), and one on the Ground Level adjacent to Beale Street (GL 35). FJC2 as specified in 07 09 13 appears to be for the W-12 system, and 07 09 15 does not appear to specify a seismic joint for FJC2.

Please provide a specification for the FJC2 joint located at the Ground Level.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The enclosed SKA-3735, SKA-3736 Drawings and Specification pages with 07 09 13 markup clarify seismic joint assemblies FJC1 and FJC2 accordingly.

Revised construction documents will be submitted in forthcoming ASI.

P1-0215 **Panel Noise and Vibration** **Closed** **07/01/2014** **07/11/2014** **07/11/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference 2014/06/16 W-1 Re-issued for Bid 08 44 27 2.2N
Noise and/or vibration due to wind are listed as an unacceptable conditions. There is the possibility that wind will create noise and/or vibration in properly installed panels because of factors such as (but not limited to) perforations and gaps between panels. If provisions remains in the specifications, they may result in additional cost in the bids and/or limit the bidding pool. Confirm that noise and/or vibration caused by wind within properly installed panels will be acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

JV, TJPA, PMPC, and the design team discussed this extensively. The specification as written is the agreed upon Contract Document. Noise and/or vibration caused by wind are not acceptable and are assumed, until determined otherwise, to be an indication that the panels are not installed properly.

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:**

Co-Author:

REQUEST:

Reference Specification Section 08 44 27 Section 2.2N (TG08.2 Issued for Rebid Documents)

Please confirm that noise due to wind moving through the patterns cut out in the Aluminum Panels of the Exterior Awning and through the gaps between the panels Exterior Awing and noise due to wind moving above and below the entire system is not to be considered an unacceptable condition. The contractor is providing the pattern per the contract documents and they will have no control over any noise due to wind moving through the predetermined pattern, gaps between each panel and wind moving above and below the entire system. The contractor should only be responsible for noise due to vibration caused by poor workmanship and should not be responsible for any noise due to the inherent design of the W-1 Exterior Awning.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

P1-0216	**Touch up Specification**	**Closed**	**07/01/2014**	**07/11/2014**	**07/11/2014**	**Potentially**	☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference 08 44 27 3.10 F.1.b
Specification Section 08 44 27 calls for touchup so that repair is invisible from a distance of 2 ft. According to PDCA P1-04 TOUCH-UP PAINTING AND DAMAGE REPAIR (see attached), Section 2.3 states: "...In order to determine whether a surface has been "properly painted" it shall be examined without magnification at a distance of thirty-nine (39) inches or one (1) meter, or more, under finished lighting conditions and from a normal viewing position."

Based on PDCA recommendations, anything less than 39¿ may result an unnecessary increase in cost to the bids. Additionally, the nearest normal viewing position of the final constructed awning will be several meters. Please confirm that the 2 ft. requirement is to remain.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed, follow the Contract Documents.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0217	Multiple Seismic Joint Assembly Manufacturers per Specification Section 07 09 13	Closed	07/02/2014	07/12/2014	07/22/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Transbay PMPC Ray Quesada

Co-Author:

REQUEST:

REFERENCE: Specification Section 07 09 13 2.2 A 1 (IFC Drawings for Main Package dated 3/31/14)

Per Specification Section 07 09 13 2.2 A 1, Construction Specialties, Inc. is the basis of design for the seismic joint assemblies. As such, the details associated with the seismic joints which were bid out to Shimmick and Skanska were based upon Construction Specialties, Inc. Specification 07 09 13 2.2 A goes on to list another 3 manufacturers which can be used. Since each manufacturer may require different block-outs, embeds, attachment to structure, etc., there could be some added unforeseen costs if a bidder uses a product which is not the basis of design.

Would TJPA like us to direct the bidders to cover any costs associated with any changes required due to the use of a product which is not the basis of design, or would TJPA like to carry the risk/costs associated with this?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Let the bidders know that Construction Specialties is the basis of design and that the bidder will need to cover any costs associated with using one of the other listed manufacturers.

P1-0219	Seismic Joint Type FJC1 Within the Roof Park Landscaping/Paving	Closed	07/02/2014	07/12/2014	07/11/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REFERENCE: Sheet A1-8880 (IFC Drawings for Main Package dated 3/31/14)

Per Sheet A1-8880, Seismic Joint Type FJC1 is located within the roof park landscape/paving. Is Seismic Joint Type FJC1 to be deferred with the rest of the roof park?

Seismic Joint Type FJC1 is a Base Building component that is required to enclosed and waterproof the building and therefore it is not deferred with the park.

The seismic joint cover infill material may be installed per construction scheduled activities determined by the contractor.

P1-0220 **Park Deferral Waterproofing** **Closed** **07/02/2014** **07/02/2014** **07/11/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: Addendum #11 Dated 05-16-14 A1-8404 detail 1
Due to the deferral of the roof park landscaping items that would have been covered, the waterproofing and drainage gutter assembly for the W-10 Skylight, be exposed to UV and weather for a prolonged period of time. Please provide any provisions necessary to mitigate this changed condition.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This RFI refers to a question previously answered in RFI P1-135. The components of detail 1/A1-8404 are not impacted by the issues on RFI P1-0135.

P1-0221 **Inconsistent Drawing and Specification Titles for Expansion/Seismic Joints** **Closed** **07/02/2014** **07/02/2014** **07/11/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Sheet A1-8880 , Specification Section 07 09 13 (IFC Drawings for Main Package dated 3/31/14)

Sheet A1-8880 is titled "Expansion Joint Schedule". Specification Section 07 09 13 is titled "Seismic Joint Assemblies". Please change one of the titles to match the other.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Sheet A1-8880 is titled "Expansion Joint Schedule", because it provides in a listing form graphical aspects of all expansion joints; it includes other expansion joints not found on Specification Section 07 09 13. Specification Section 07 09 13 is titled "Seismic Joint Assemblies" and puts forth the technical specification of seismic joint assemblies. The two documents do not provide the same information, thus titles are not the same.

P1-0226	Materials for Seismic Joint Assemblies per Specification Section 07 09 13	Closed	07/02/2014	07/12/2014	07/11/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Specification Section 07 09 13 2.5
Specification Section 07 09 13 2.6
Specification Section 07 09 13 2.7
Specification Section 07 09 15

Spec Section 07 09 13 2.5 indicates the materials and coatings to be used. Spec Section 07 09 13 2.6 indicates that the joint assembly design to be based upon the design shown. Spec Section 07 09 13 2.7, indicates that an engineer is to design the materials for use in the seismic joints. Are the subcontractors to follow Spec Section 07 09 13 2.5 as per Spec Section 07 09 13 2.6, or redesign the materials per Spec Section 07 09 13 2.7? This is similar to Spec Section 07 09 15.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 07 09 13 / 2.5 and 07 09 13 / 2.6 are correct as stated. At the request of the CM/GC in different review meetings, the TJPA directed the Design Team to delete the requirement for a Corrosion Engineer in all the Glazing and Cladding specifications.

Specification Section 07 09 13 /2.7 is not incorrect as currently issued. However, to further reduce costs on the Project, Specification Section 07 09 13 / 2.7. will also be revised to deleted the requirement of a Corrosion Engineer and will state the following:

"Conduct a component-by-component analysis of potential corrosion resulting from galvanic action between materials, for components of the work of this section and provide report."

This revision will also be applied to specification Section 07 09 15. These two Specifications will be re-issued in subsequent ASI.

P1-0230.1	Details and Specifications for Concrete Sloping to Zero Thickness	Closed	07/15/2014	07/25/2014	07/22/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0230

Per RFI Response P1-0230, topping slab concrete is to be as specified in Specification Section 03 30 02. Per Specification Section 03 30 02, all concrete mixes, excluding the concrete fill at basket columns, have a 3/4" aggregate.

In several locations (Train Platform Level GL 2 - 4 and GL A - F for example) show the topping slabs sloping to zero thickness. This condition will not allow the use of aggregate or reinforcing as noted on the revised sheets in the response to RFI Response P1-0230.

Please provide details and specifications for sloping of concrete to zero thickness.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

For typical detail for concrete at the small ramps, refer to Structural detail 5/S1-5003.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0230.2	Concrete Ramp Details for Structual Slabs Poured per Slab Plans	Closed	07/22/2014	08/01/2014	08/05/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: RFI Response P1-0230.1, Detail 5/S1-5003 (IFC Drawings for Main Package dated 3/31/14)

RFI Response P1-0230.1 references Detail 5/S1-5003 for the installation of small ramps. Per Detail 5/S1-5003, there is a minimum slab thickness of 2" at the ramp, to saw cut the concrete at the nose of the ramp, and to roughen the surface of the structural slab to receive the ramp.

Architectural slab edge plans do not show depressions within the structural slabs where these ramps exist (topping slab ramps or housekeeping pad/mechanical pad ramps). As such, a 2"x40" swath of concrete would need to be removed where concrete has been poured per the slab plans (note - mat slab rebar is 1.5" clr. from the t.o. slab, 1 way slab and composite deck rebar is 3/4" clr. from the t.o. slab).

Please provide revised concrete ramp details where structural slabs have been poured per the slab plans.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The referenced structural detail calls for saw cut and roughening of the slab to ¼¿ amplitude. The architectural slab edge drawings are not intended to show areas of slab roughening.

The small ramps have been shown on the architectural zone plans and on the structural details since well before the Below Grade Package TG07 Issue for Construction. Execution of this a contractors means and methods item and the drawings do not need to be revised as requested in this RFI.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0230.3	Rebar Depressions and Fixes at 2" Depressions	Closed	08/14/2014	08/24/2014	08/27/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Detail 5/S1-5003 (IFC Drawings for Main Package dated 3/31/14)

Detail 5/S1-5003 requires a minimum 2" thickness of concrete for the ramp. In order to maintain a minimum 2" thickness, a depression in the slab will need to be provided at the ramps. Depressions are shown on the slab edge plans.

Train platform, lower concourse decks, and associated reinforcement are part of TG06, not TG07.2.

Please revise the plans to show depressions and fixes for rebar at the 2" depressions, or provide a different material

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

It is not necessary to provide depressions in the slab for the small concrete ramps. As suggested in the RFI, a different material can be provide the taper of the small ramps.

Specification section 09 30 00 to be revised as follows:

09 30 00 2.7.H Leveling Topping: One of the following or equal.

1. Mapei "Planicrete 50" (basis of design)

2. Mapei "Mapecem"

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

to form the ramps which can be tapered to the thickness required (for instance Ardex).

Alternatively, all ramps, with exception to one, can be removed at the ADA path of travel and a painted step can create a warning stripe.

3. Ardex "ERM"

For small ramp taper detail refer to SKA-4033.

Revise sketch SKA-4033 note for sawcut to read, "Provide 3/4" wide by 1/2" deep blockout."

P1-0231 **Details for Embedded Plate per Detail 2/A1-9228** **Closed** **07/08/2014** **07/18/2014** **07/22/2014** **Potentially** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author:

REQUEST:

Reference: L-0006 and L-0007

While sizing the maximum load for the rooftop cranes it was communicated by PWP and TT that the maximum tree size will be no greater than 25,000 lbs and that the roof is designed for a maximum of 26,000 lbs. Confirm that the structure will be able to accommodate the additional tree weight which will incur over the years as the trees grow.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

TT Response:

The roof structure was designed for the tree weights given to us by PWP during the course of the design. It was noted that the tree weights are the "average" weight of the mature tree. For seismic design, the "average" tree weight was used, because the floor slab diaphragm will distribute the weight of all trees to the seismic force-resisting system. For gravity design of steel beams carrying the tree, a factor of safety of 2 is applied to the "average" weight to account for the situation when a specific tree outgrows the "average" weight. The tree weight for the seismic design and gravity design is tabulated in the contract document Detail 2/S-1013.

PWP Response:

The "average" size of tree materials was determined by species and available soil volume (growing medium).

P1-0236 **Details for Expansion Joint Covers in Concrete Barrier** **Void** **07/11/2014** **07/21/2014** **08/05/2014** **Potentially** ☐

REQUEST:

REFERENCE: Detail 3/SKA-3616, Details 1 & 4/SKA-3610 (ASI 119 dated 6/18/2014)

Detail 3/SKA-3616 depicts a new concrete barrier equipped with an expansion joint in place of the crash guard rail and support. Details 1 & 4/SKA-3610 illustrate the same newly added concrete barrier, omitting any details or specifications regarding the interaction between the expansion joint at the concrete barrier, bus deck, crash rail, and the adjacent W-18 fascia.

Please provide the details and specifications for the expansion joint and adjacent W-18 fascia connection referenced in Detail 3/SKA-3616 and Details 1 & 4/SKA-3610.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Refer to response to RFI P1-0201 for seismic joint cover plate detailing on the concrete barrier.

Refer to attached sketch SKA-3860 for clarification of W-18 fascia connection at the seismic joint. Note: the W-18 fascia is currently under redesign and is being changed to a W-16C metal panel as part of the VE exercise. Revised documentation/detailing will be issued as part of VE Round 4 markups being issued Aug. 18, 2014.

RFI P1-0241 response: "Refer to Edge of Slab sheets in ASI-0121 issued on 07/18/2014. Design Team does not assign scope for Trade Groups."

Edge of Slab sheets do not show block outs for bollard and barrier hydraulic and electrical lines to each of the HPUs as was discussed in RFI meeting on 05/23/2014.
- A1-2870 - Provide sleeves or blockouts for retractable bollards and barriers in the shoring wall area at vehicle ramp so that hydraulic and electrical lines may reach the HPU.
- A1-2862 - Provide sleeves or blockouts for retractable bollards and barriers at GL 1 and Natoma St. so that hydraulic and electrical lines may reach the HPU.
- A1-2864 - Provide blockout and/or sleeves for Natoma loading dock area so that hydraulic and electrical lines may reach the HPU.
- A1-2866 and A1-2867 - Confirm that 4"" SL's on GL 27 and 343.5 are for the wedge barrier hydraulic and electrical lines to reach the HPU below. If not, provide sleeves or blockouts so that hydraulic and electrical lines may connect to the HPU.

REQUEST:

reference: ASI 118, 119 and A1-7424 (SKA-3532)

There are discrepancies between ASI 118 (Addendum #4) and ASI 119 for this sheet. ASI 118 and 119 are both dated 06/20/2014. Confirm that ASI 119 is meant to take precedence. It does not appear to be the most current version.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Per request of WOJV and PMPC, all VE items issued in ASI 0118 (MEP/TE/SE/VT Issued for Bid Addendum 4) which were not related to MEP package were provided in ASI 0119. ASI 0119 is a combination of "VE Round 2" and "MEP/TE/SE/VT Issued for Bid - Addendum #4". This sheet - A1-7424 (SKA-3535) is the same sheet in each package.

Per specification section 01 10 40 / 1.6 C.2.d "RFIs shall not be used for the following: the TJPA will not reply and will reject the RFI: d. Questions on contract administration procedural matters, unless they required interpretation or clarification of the Contract Documents." This questions relates to a contract administration procedural matter that WOJV jointly determine and assisted in providing direction on how the documents were to be issued and labeled. WOJV has not coordinated knowledge of this matter between

P1-0276	Sequence of Operation Anti-Ram Barriers	Closed	07/15/2014	07/25/2014	08/25/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: 28 16 44/APA ASI 119

Provide sequence of operation for Bus Plaza Anti-Ram Barriers and their integration with the traffic control system, including but not limited to, types of output required (when does the traffic light change color, which traffic light changes color for each barrier, what stage of barrier operation aligns with each output) and extent of interaction with traffic lights. For example, do lights at Howard and Mission street change color depending on status of lights at the Bus Plaza Anti-Ram Barriers?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Control system to provide an output to the traffic control system in Section 34 41 13 to indicate barrier deployment.

2. The barrier control system will trigger a relay associated with the specific lane/barrier that the operator is controlling for an outbound bus.

3. The traffic lights controlling the flow of traffic on the public street is to begin their sequence to stop traffic (e.g. turn red).

4. After the traffic light has indicated vehicles on the public street are to stop, the light associated with the lane of the exiting bus shall change state to indicate to the bus operator that they can proceed.

5. After the bus clears the barrier, the barrier operator will trigger the system via the control to change the bus exit light to red.

6. Once the exit light is red, the barrier is to rise to the secure position and the traffic light associated with the vehicles traveling on the public roadway is to reset to indicate that vehicles can proceed.

7. Final sequence operations to be coordinated with the Owner's security concept of operations and with the traffic light control system contractor.

P1-0277	Vehicle Barrier Timing	Closed	07/15/2014	07/25/2014	08/20/2014	Potentially	☐

REQUEST:

REFERENCE: Detail 11/A1-9208 (ASI 118 dated 6/20/14), A-0024 (IFC Drawings for Main Package dated 3/31/14)

Per Detail 11/A1-9208 of ASI 118, and associated zone plans, concrete columns are to be framed in with wall type 3-R1. Per Sheet A-0024, there is no Comment R1 for Wall Type 3.

Please provide the R1 requirements for Wall Type 3.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Please refer to SKA-3913 and SKA-3914 for the R1 (modifier) requirement of Wall type 3.

P1-0284	Category 3 Stairs, Platforms, and Rails for Phase 1	Closed	07/16/2014	07/16/2014	08/20/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Sheet SKA-3076 (dated 3/13/14)

TJPA did not accept TG07.5R Bid Additive Alternate No. 01 to furnish and install Category 3 stairs, platforms, and rails as shown on SKA-3076 (Attached).

Category 3 metal stairs, platforms, and rails still show on the contract documents, however TJPA has indicated they do not intend for the Category 3 metal stairs, platforms,

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

and rails to be installed as shown.

Please confirm stairs, platforms, and rails are not to be provided as part of Phase 1 at Category 3 locations, or provide direction for the desired access at these locations.

P1-0285 **Concrete Curbs at Lower Concourse, Zone 4** **Closed** **07/16/2014** **07/26/2014** **08/20/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Sheet A1-2207 (ASI 118 dated 6/20/14)

Sheet A1-2224 of ASI 118 calls out concrete curb types at the following locations:

GL 14/G, GL 19/C, GL 24/H, GL 31/F.7, GL 32/C, and GL 32/G

The concrete curbs at the above locations are depicted with dashed lines. Are concrete curbs called out but shown dashed to be furnished and installed as part of Phase 1?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The concrete curbs at locations mentioned and depicted with dashed lines are furnished and installed in Phase 2. These dashed lines are for setting out of splice couplers for future phase 2 washrooms walls with concrete curbs.

P1-0286 **Specification for Chain Linked Fences** **Closed** **07/16/2014** **07/26/2014** **08/20/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: A1-2104 (ASI 119 dated 6/20/14)

ASI 119 calls out for a chain link fence at several locations (A1-2104 for instance), but no chain link fence specification exists.

Please provide a specification for chain link fences.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Jeff Heath, WOJV indicate they do not require a specification for Chain Linked Fences as requested by this RFI. Therefore this RFI should be withdrawn.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0287	Directional Notes for Changes on Sheets A1-2202 Through A1-2207 of ASI 119	Closed	07/16/2014	07/26/2014	08/20/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Sheets A1-2202 through A1-2207 (ASI 119 dated 6/20/14)

Sheets A1-2202 through A1-2207 of ASI 119 show clouds around openings, however notes outlining the changes are not provided (see attached A1-2205 for example).

Please provide information for clouded openings with no directional notes.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

All lower concourse floor openings are provided with guardrails (see typical details on A1-7027). All guardrails are to be removed and replaced with chain link fence as outlined in VE item ID_44 and attached ASI-119 Revision narratives

P1-0289	1-3/4" Step in Loading Dock 01222	Closed	07/18/2014	07/28/2014	08/27/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Sheet A1-2302, Sheet A1-6012 (IFC Drawings for Main Package dated 3/31/14)

Per Sheet A1-2302 and Sheet A1-6012, there is a 1-3/4" step in the loading dock topping slab, 1'-10" east of GL 5 between GL C and GL D.

This step is in the drive area of the loading dock, and may be a long term maintenance item (spalling concrete due to trucks and dumpsters rolling over the step).

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Provide 4"x 4"x 3/8" continuous cast in HD galvanized steel angle to topping slab along slab edge step (approximately grid 5 and grid 6).

Refer to sheet A1-3100 for slab elevations. The steps in the slab noted, along approximately grids 5 and 6, actually vary due to the slope in the Lower Loading Dock slab.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Please confirm a 1-3/4" step is desired rather than sloping the concrete at this condition.

P1-0290 **Painted Galvanized Flashing per ASI 119 and Specification Section 07 62 00 2.3 A** **Closed** **07/18/2014** **07/28/2014** **08/20/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: ASI 119 (dated 6/20/14), Specification Section 07 62 00 2.3A (IFC Drawings for Main Package dated 3/31/14)

ASI 119 calls for painted galvanized flashing to be used in several locations (for instance, Detail B/A1-7407 of ASI 119). Specification Section 07 62 00 2.3 A states, "Galvanized Steel: Do not use."

Please provide a specification for the painted galvanized flashing.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

See the attached Specification Section 07 62 00 / 2.3.A that has been revised to include the galvanized steel flashing language.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0291	Engineering Requirements for Spray On Fireproofing per Specification Section 01	Closed	07/18/2014	07/28/2014	08/05/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)
Specification Section 01 80 50 1.1 B
Specification Section 01 80 50 1.2 A
Specification Section 07 81 00
Specification Section 07 81 23

Per Specification Section 01 80 50 1.1 B, "the requirements of this Section apply when to all non-structural components, unless otherwise noted."

Per Specification Section 01 80 50 1.2 A:
"Non-structural building components are components that are not part of the building structural
system whether inside or outside the building enclosure, above and below grade. Nonstructural
components of the Transbay Transit Center include, but not necessarily limited, to
the following:
1. Ceilings, glazing, awnings, and similar components and assemblies.
2. Electrical: Power and lighting components and systems; substations; switchgear and
switchboards; auxiliary engine-generator sets; transfer switches; motor control centers;
motor generators; selector and controller panels; fire protection and alarm components
and systems; and telephone and communication components and systems.
3. Mechanical: Heating, ventilating, and air-conditioning components and systems;
plumbing components and systems; fire sprinkler components and systems.
4. Vertical Transportation: Mechanical, electrical and supporting elements for transport
systems, including elevators and escalators. "

Specification Section 07 81 00 Sprayed Fire Resistive Material and Specification Section 07 81 23 Intumescent Fire Resistive Material do not include items specifically noted in the non-structural list, however, Specification Section 01 80 50 1.2 A explicitly states the list is not all inclusive. In addition, 07 81 00 and 07 81 23 do not specifically exclude the requirements assoicated with 01 80 50.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The work of Specification Section 07 81 00 Sprayed Fire Resistive Material and Specification Section 07 81 23 Intumescent Fire Resistive Material do not have seismic requirements.

Specification Section 01 80 50 will be revised to list applicable Specification Sections and Specification Sections requiring seismic criteria will reference Section 01 80 50.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Please confirm material furnished and installed under Specification Sections 07 81 00 and 07 81 23 are not required to have engineering as required by Specification Section 01 80 50. If engineering is required for items furnished and installed under Specification Sections 07 81 00 and 07 81 23, please specifically identify which elements are to be engineered.

P1-0292 **Grout Placement Beneath Drain Hole at Rail Embed** **Closed** **07/18/2014** **07/28/2014** **08/20/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Detail 6/A1-9306 (ASI 119 dated 6/18/14)

Per Detail 6/A1-9306, the HD galvanized rail embed shows a drain hole in the bottom of the embed. The detail goes on to show the bottom of the embed seated in grout which will prevent water from draining out of the drain hole.

Please confirm plugging the rail embed drain hole as shown in 6/A1-9306 is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Provide ½¿ diameter drain hole in embed; drill 3/8¿ diameter hole through mortar to allow for drainage down to substrate.

P1-0293 **Bus Bridge Crash Rail Material Confirmation** **Closed** **07/18/2014** **07/28/2014** **08/20/2014** **Potentially** ☐

Co-Author:

REQUEST:

REFERENCE: Detail 2/A1-8378 (ASI 119 dated 6/18/14)

Per the current Bus Bridge Contract Documents, the Bus Bridge Crash Rail is metal as it approaches the Bus Deck.

Per Detail 2/A1-8378 of ASI 119, the Bus Bridge Crash

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed. The Bus Bridge crash rail is metal per the Bus Bridge contract documents. Per VE item # 32, the Transit Center Building crash rail at the Bus Deck level is concrete. Locations of the respective crash rails at the Bridge/Building joint have been coordinated in the attached sketch, SKA-3661-R2.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Rail is changing to match the concrete crash rail of the Bus Deck.

Please confirm the Bus Bridge Crash Rail design, and coordinate drawings to match.

P1-0294 **Method of Construction for Concrete Column Steel Jacket Base** **Closed** **07/18/2014** **07/28/2014** **08/20/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Detail 1/A1-9208 (ASI 118 dated 6/20/14), Detail 6/S1-3503 (IFC Drawings for Main Package dated 3/31/14)

Per Detail 1/A1-9208 of ASI 118, the concrete column steel jacket base are welded studs/post installed expansion anchors, and to refer to structural for sizing.

Per Detail 6/S1-3503, welded studs are to be used at the lower concourse, post-installed anchors are to be used at the mat slab (train box), and jacket base plate is poured integrally to the slab whether welded studs or post-installed anchors are used.

Based upon the current construction and bid schedules, steel jackets will not be procured prior to pouring mat slab and lower concourse deck.

Please confirm post applied anchors can be furnished and installed at all locations column steel jacketing is required, and that the jacket base plate can be placed on top of the slab/deck where the slab/deck has been poured prior to column steel jacket installation.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Arup response:

Confirmed that post-installed expansion anchors at mat-slab(train platform level) and lower concourse level can be furnished and the jacket base plate can be placed on top of slab where the slab has been poured prior to column steel jacket installation.

TT response:

Drilling of the holes for the post-installed expansion anchors shall not damage the slab reinforcement rebars. Fabrication of the base plate shall be done based on the field locations of the anchors

P1-0295	Thickness of AESS Closure Elements	Closed	07/21/2014	07/31/2014	08/20/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)
Sheet A1-8690
Sheets A1-8692 through A1-8695

Sheet A1-8690 and Sheets A1-8692 through A1-8695 call out for AESS closure elements to be welded per structural, and finished per the AESS specification.

However, the details for the AESS closure elements do not call out the thickness of the material.

Please provide the thickness of the AESS closure element material.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The plate thickness is 3/8" thick, per drawings: 8/S1-4351, S1-4350, S1-4352 and S1-4353.

Also, RFI T-1517 acknowledged 3/8" thick plate.

P1-0309	Knox Box	Closed	07/25/2014	08/04/2014	08/21/2014	Potentially	☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

ASI 119 A1-2303, A1-2302, 28 16 44
There is one Knox box located on each of the referenced drawings. Confirm these are the only two Knox boxes for the entire project and none are located in the building. Confirm that these have been coordinated with the Fire Marshal and Security. Confirm these Knox boxes are key control only and that no other requirements are needed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Correct, there is only one knox box located on each of the referenced drawings.

2. Confirmed, these are the only two knox boxes.

3. Not an RFI issue and the question should be withdrawn.

4. Refer to specification 28 16 44 / 2.8 for knox box requirements.

P1-0310	Bollard and Wedge Barrier Finish Requirements	Closed	07/25/2014	08/04/2014	08/21/2014	Potentially	☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

reference: 28 16 44
Provide finish requirements for the bollards and wedge barriers. For example, provide finish type, paint color, and any other requirements. They are not included.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Barriers should be painted. Color to match Extrusion White 85±5 by TIGER Drylac 38/10090.

P1-0311	Probe Detector Locations	Closed	07/25/2014	08/04/2014	08/21/2014	Potentially	☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

reference: 28 16 44 - section 2.6.C
Clarify and provide details for location of Probe Detectors. Clarify if the probe detectors are for the wedge barriers or retractable bollards. Provide details, specifications, operation and output requirements for the probe detectors.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Road loop detectors are to be used for all the barriers. Probe detectors can be used as an alternative, which the contractor can propose if deemed a value engineering item to be considered.

P1-0312	System integration Requirements	Closed	07/25/2014	08/04/2014	08/26/2014	Potentially	☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

28 16 44 - section 3.8.D
""All software and IP devices of this system shall be integrated as a part of and shall be fully compatible with operating in the Converged IP-based Network to be installed at the Transbay Transit Center."" Confirm that all requirements to comply with the future system integration are stated in this section.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Contractor will be required to coordinate with the network designer of the converged IP-based network.

P1-0313 **ASI 118 and 119 Discrepancies** **Closed** **07/25/2014** **08/04/2014** **08/21/2014** **Potentially** ☐

From: Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Transbay PMPC Ray Quesada

Co-Author:

REQUEST:

See attached sheets, A1-7416, A1-7416 (SKA-3524), A1-7418, A1-7418 (SKA-3526), A1-7419, A1-7419 (SKA-3527), A1-7420, A1-7420 (SKA-3528), A1-7421, A1-7421 (SKA-3529), A1-7422, A1-7422 (SKA-3530), A1-7423, A1-7423 (SKA-3531), A1-7424, A1-7424 (SKA-3532), A1-8720, A1-8720 (SKA-3542), A1-8721, A1-8721 (SKA-3543).
There are discrepancies between ASI 118 (Addendum #4) and ASI 119 for these sheets. ASI 118 and 119 are both dated 06/20/2014. Confirm that ASI 119 is meant to take precedence. It does not appear to be the most current version.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ASI #119 was issued to relay specific scopes of work that are either deleted or modified to reflect scope reduction. Be advised that the backgrounds and dates in the revision box of ASI #119 documents are older versions of sheet issuances and do not reflect the most updated backgrounds or revision dates. These documents are only to be used to determine whether items identified with edit clouds and included in the Narrative, provided with ASI #119, are either scope reductions or deletions.

P1-0315	Structural Information on OCS Trough Support	Closed	07/28/2014	08/07/2014	08/05/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Detail 3/A1-8551 (IFC Drawings for Main Package dated 3/31/14)

Detail 3/A1-8551 indicates that information on the OCS Trough Support is located on structural drawings.

S1-9010 does not provide information on this member.

Please provide structural information on the OCS Trough Support.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The structural drawings provide information for the OCS HSS vertical supports. Detail 3/A1-8551 shows a suggested field method of fastening the OCS assembly to the vertical HSS structural supports by way of an HSS sleeve. Contractor may modify this detail as they see fit to install OCS assembly with coordination with SFMTA.

Moreover, RFI T-1417.3 response has already recommended the CM/GC schedule a meeting with all the stake holders to resolve all OCS questions.

P1-0339	Base Bid Item Confirmation for Alternate No. 27 - Delete Roof Park Level Café	Closed	07/31/2014	08/10/2014	08/21/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Specification Section 01 10 30 APE E.1.15, Sheet A1-2605 (ASI 122 dated 7/23/14)

Specification Section 01 10 30APE E.1.15 - Alternate No. 27 states, "Provide lid over structural foundation complete with waterproof membrane." then references Sheet A1-2605.

Sheet A1-2605 of ASI 122 notes, "Defer W-20 glass cafe. Retain circular foundation wall with topping slab. All utilities should be stubbed up below the topping slab."

In accordance with Sheet A1-2605 of ASI 112, please confirm that Specification Section 01 10 30APE E.1.15 - Alternate No. 27 is accepted as a base bid item.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

No, it has not yet been confirmed by TJPA that item E.1.15 ¿ Alternate No. 27 of Specification Section 01 10 30APE has been accepted as a base bid item.

We suggest that WOJV discuss scope of work to be bid and status of TJPA direction on these items directly with TJPA when possible.

Co-Author:

REQUEST:

REFERENCE: Details 1 and A/A1-8630A (IFC Drawings for Main Package dated 3/31/14)

Detail 1/A1-2605 depicts two 30" diameter manhole access openings with steel plate covers to be installed in Future Café PK560. The manhole access openings will create access points for water to enter the crawl space depicted in Detail A/A1-2605.

The crawl space beneath Future Cafe PK560 illustrated in Detail A/A1-2605 is not equipped with drainage or waterproofing to combat water entry.

Please confirm that this is acceptable or provide waterproofing details for the crawl space beneath Future Cafe PK560.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The two 30" access manholes shown on A1-8630A are deleted. Refer to attached SKS-0395 and SKA-4076 for area where slab may be saw-cut in the future to access crawl space.

Run waterproofing system as shown continuously above the structure over the crawl space and over the future saw-cut access opening.

Waterproofing is not required in the crawl space beneath Future Cafe PK560.

Co-Author:

REQUEST:

REFERENCE: Detail A/A1-8630A, Detail 1/S1-3281A (IFC Drawings for Main Package dated 3/31/14)

Detail A/A1-8630A depicts the concrete slab in Future Café PK560 to be level with the top of the adjacent concrete wall.

Detail 1/S1-3281A depicts the concrete slab meeting below the top of the adjacent concrete wall.

Please coordinate the details for the connection of the concrete slab and adjacent concrete wall to match.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Structural drawing has been revised to match Architectural. See attached sketch SKS-0394.

P1-0343 **Deferral of Pylon Footings per ASI 122** **Closed** **07/31/2014** **08/10/2014** **08/21/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Webcor Construction LP Andrew Kitchen

Co-Author:

REQUEST:

REFERENCE: ASI 122 dated 7/23/14, Detail 4/S1-3281A (IFC Drawings for Main Package dated 3/31/14)

Per ASI 122 sheet notes, all pylons are deferred.

If pylon footings are to be deferred, the anchor bolts will also be deferred. This will prevent footings from being installed as currently designed in Detail 4/S1-3281A.

Note that pylon footing is currently included in the Trade Package TG07.2 contract.

Please provide revised footing details, or designate the anchorbolts to be used.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The pylon footings are not deferred, per ASI 122 A1-2602 (SKA-3704) as well as other roof park zone plans, and are to be constructed as per detail 4/S1-3281A.

Co-Author:

REQUEST:

REFERENCE: Sheets A1-9532 through A1-9534 (IFC Drawings for Main Package dated 3/31/14)

Per Sheets A1-9532 through A1-9534, the topping slab is to receive a scratch coat. The scratch coat may have too high of an amplitude to receive traffic coating. In addition, the contract documents do not require a traffic coating at the drive aisle.

Per the email from Mark O'Dell sent on 7/29/14, traffic coating will be added to the Bus Deck Level. Details and specifications have not been provided for the traffic coating at the Bus Deck Level.

Please confirm that the topping slab is to receive a scratch coat and provide the traffic coating details and specifications per prior discussions.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Correction, the topping slab referenced is required to receive a scratch finish, not a scratch coat; this is confirmed.

Specification section ¿07 18 14 ¿ Floor Coatings (FC-1, FC-2)¿ is currently being updated to document the traffic coating to be added to the Bus Deck Level traffic/topping slab. This will be issued in an upcoming ASI.

Co-Author:

REQUEST:

REFERENCE: Specification Section 07 54 19 1.1 A 2 b (IFC Drawings for Main Package dated 3/31/14)

Specification Section 07 54 19 1.1 A 2 b states, "Roofing

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

In specification section 07 54 19, delete item 1.1.A.2b referencing one story structure east of Beale Street. No such building exists under this contract.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

low slope roofs on one story structure east of Beale Street with a one-ply PVC membrane, fully adhered to a cover board and insulation."

The contract documents do not give any information on a one story structure east of Beale St.

Please provide information on the referenced one story structure.

P1-0365 **Fireproofing at Park Level W-4 Steel Ring Beam** **Closed** **08/14/2014** **08/24/2014** **08/25/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Detail 2/A1-8237D (ASI 120 dated 7/11/14)

Detail 2/A1-8237D of ASI 120 calls for fireproofing at the steel ring beam.

No fireproofing is shown at the column supporting the steel ring beam.

Please confirm that fireproofing is not required at the column shown in Detail 2/A1-8237D. If fireproofing is required at the column supporting the steel ring beam, please provide the details and type for the required fireproofing.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Sheets A1-8662 and A1-8663 indicate the scope and application of steel fireproofing requirements for the project. Details graphically show the fireproofing in the vicinity of the specific condition drawn, if the steel element is being cut, the fireproofing is shown in section, if the element is not cut (it is in the background) typically the fireproofing is not shown--this is standard graphic convention. For the extent of all fireproofing of ALL structural steel, please refer to Fire Protection Matrix and Schedule in sheets A1-8662 and A1-8663.

P1-0366	Top of Step Elevation for Stair 601	Closed	08/14/2014	08/24/2014	08/21/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Sheet L1-3606 (IFC Drawings for Main Package dated 3/31/14),
Details 1 & 2/A1-8651 (ASI 122 dated 7/23/14)
Detail 3/A1-8652 (ASI 122 dated 7/23/14)

Sheet L1-3606 shows a top of step elevation of 86.90 at Stair 601.

Details 1 & 2/A1-8651 shows a top of step elevation of 86'-9" at Stair 601 then refers to Detail 3/A1-8652.

Detail 3/A1-8652 also shows a top of step elevation of 86'-9".

Please confirm the correct elevation and coordinate the plans and details to match.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This RFI is incorrect. Drawings A1-8651 and A1-8652 (ASI 122 date 7/23/14) clearly show the top of step elevation above the Park Level elevation of 86'-9". See notes on 2/A1-8651 and 3/A1-8652, which refer to Landscape drawings for stair elevations. The Architectural and Landscape drawings are coordinated.

P1-0367	Deferral of Expansion Joint Covers per ASI 122	Closed	08/14/2014	08/24/2014	08/27/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: ASI 122 - VE Round 3 dated 7/23/14

Per ASI 122 dated 7/23/14, the Roof Park expansion joints have not been deferred, but their covers have been deferred.

Expansion joints and all associated components are sold as a unit. This will affect the warranty (depending if the park is built out) and result in added cost with little benefit.

Please confirm TJPA wants W/O to contract out the entire roof top park expansion joint assembly at grid lines 10 and 20 except the cover.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The decision to defer the grade level seismic joint covers, as noted on SKA-3706, SKA-3708 and SKA-3819 issued as part of ASI 122, is rescinded. Covers are to be provided as part of the complete seismic joint assembly. If the Roof Park is still being deferred at time of installation then an alternate pan infill material will be proposed at that time.

P1-0376	Exterior Awning Noise Due to Wind	Closed	08/14/2014	08/14/2014	09/01/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference Specification Section 08 44 27 (W-2 Reissued for Bid Set)

Please confirm that noise due to wind moving through the patterns cut out in the Aluminum Panels of the Exterior Awning and through the gaps between the panels Exterior Awing and noise due to wind moving above and below the entire system is not to be considered an unacceptable condition. The contractor is providing the pattern per the contract documents and they will have no control over any noise due to wind moving through the predetermined pattern, gaps between each panel and wind moving above and below the entire system. The contractor should only be responsible for noise due to vibration caused by poor workmanship and should not be responsible for any noise due to the inherent design of the W-1 Exterior Awning.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed. Specification Section 08 44 27 paragraph 2.2 N will be revised to state: "Unacceptable Conditions: "Vibration harmonics, noise or vibrations created by loosening, weakening or failure of fasteners, attachments or other components".

P1-0381	W-2 Schedule of Unit Prices	Closed	08/20/2014	08/30/2014	09/22/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference 08 44 25 (ASI 120 and Div. 00/01 Specifications)

Specification Section 08 44 25 subsection 1.3 calls for a unit price for Temporary Retail Façade and Glass Retail Façade for 2, 3 and 4 bay modules. There is not a Schedule of unit prices specification for the W-2 system in the Div. 00/01 dated August 11, 2014. If a unit price is required for the Temporary Retail Façade it needs to be included in the Div. 00/01. Currently the only unit price specifications listed are 01 10 20/APA for TG03, 10 10 20/APB for TG04.5.1, 01 10 20/APC for TG04.3, 01 10 20/APD for TG04.4, 01 10 20/APE for TG04.1, 01 10 20/APF for TG04.2, 01 10 20/APG for TG04.6, 01 10 20/API for TG06.0, and 01 10 20/APJ for TG18.1. If unit pricing for Temporary and Glass Retail Façade is desired, provide unit price specification, otherwise revise specification to not include unit pricing language.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The unit price requirement for the temporary retail facade change to a glazed facade will be changed to an additive alternate, to be priced below the line. Please refer to attached marked up specification sections 01 10 30/APA and 08 44 25, and to attached sketches A1-8189 (SKA-3851-R2) and A1-8190 (SKA-3852-R2).

P1-0382	Glazing Schedule of Alternates	Closed	08/20/2014	08/30/2014	09/10/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference 01 10 30/APE (Div. 00/01 Specifications 08/11)

The schedule of alternates for the design build glazing systems was not included in the August 11, 2014 issuance of the Div. 00/01 specifications. Any alternates that are desired for the TG08.10 Glass Curtain Wall (W-2, 3, 4, 6, and 8) need to be included in the Div. 00/01 specifications. Currently the only alternates that affect the TG08.10 package are alternate # 4 which deletes the Beale Street Lobby and #31 which changes the W-2 glass from low iron glass to standard clear. If any other alternates are desired, provide them in the 01 10 30/APE specification.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Refer to attached markup of the revised Specification Section 01 10 30/APE:

Delete paragraph E.1.19 Alternate No, 31: Change specified glass substrate for W-2 glass type from Low Iron glass to Standard clear Glass. Refer to the following Contract Documents: Specification Section: 08 80 03 Glass Types.

Refer to attached markup of the revised Specification Section 01 10 30/APA:

Delete paragraph A.1.3 Alternate No. 3: For W-4 Aluminum-Framed Curtain Wall System, provide an alternate to add reinforcement to vertical and horizontal mullions; add electrical pull string for future wiring; add any required prep for fastening the LED Art wall panels in the future; Details per sheet A1-8247 extent shown in sheets A1-8230 to A1-8232.

Add paragraph A.1.4 Alternate No, 4: Change specified substrate for all W-2 and W-6 glass types from Low Iron Glass to Standard Clear Glass. Refer to Specification Section: 08 80 03 Glass Types.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REQUEST:

REFERENCE: Detail 6/A1-7554 (IFC Drawings for Main Package dated 3/31/14)

Detail 6/A1-7554 calls for WPM-5 crystalline waterproofing to cover insulation and a steel mullion at the second level of the W-2 escalator pit.

WPM-5 crystalline waterproofing is specifically intended for sealing of concrete, and will not work on steel.

Please provide direction to the type of waterproofing to be used at this condition, and associated waterproofing details.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Correction, the detail does not call for the WPM-5 waterproofing to cover insulation and steel million. The detail calls out for a "AIR/VAPOUR BARRIER LAPPED TO WPM-5 AND SEALED". Refer to W-2 specification 08 44 25 for Air/Vapour type.

P1-0387 **Corner Guards Dimension Details per ASI 123** **Closed** **08/21/2014** **08/31/2014** **09/03/2014** **Potentially** ☐

Specification Section 05 41 00 1.6 G
Specification Section 09 22 19 1.6 K
Specidication Specification 08 05 13
Sheet A-0023

Specification Section 05 41 00 1.6 G and Specification Section 09 22 19 1.6 K require design-build work complying with Specification Section 08 05 13 "where shown on drawings and on Partition Schedule drawing A-0023."

Sheet A-0023 does not indicate any wall type needing to meet the design requirements of Specification Section 08 05 13.

Please confirm that none of the wall types identified on Sheet A-0023 are required meet the design requirements of Specification Section 08 05 13.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The response to this question is available only to bidders who have been granted access to the TJPA¿s secure website.

P1-0389	CJC4 Expansion Joint at Second Level GL 10	Closed	08/21/2014	08/31/2014	09/01/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Sheet A1-8880 (ASI 123 dated 8/6/14)
Sheet A1-9604 (IFC Drawings for Main Package dated 3/31/14)

Sheet A1-8880 of ASI 123 directs for the installation of a CJC4 expansion joint within the gypsum board ceiling at GL 10 on the Second Level.

Per Sheet A1-9604 of IFC Main Package, the ceiling for Room 02320 is exposed to structure, not a gypsum board ceiling.

Please confirm no ceiling expansion joint is to be installed at Second Level GL10.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed, ceiling expansion joint type CJC4 is not to be installed in Room 02320.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0390	WJC4 Adjoining Materials	Closed	08/21/2014	08/31/2014	09/05/2014	Potentially	☐

Co-Author:

REQUEST:

REFERENCE:
Sheet A1-8880 (ASI 123 dated 8/6/14)
Detail 2/A1-8178 (IFC Drawings for Main Package dated 3/31/14)

Sheet A1-8880 of ASI 123 calls out for WJC4 to have adjoining materials of gypsum board.

Detail 2/A1-8178 of IFC Main Package does not show gypsum board in the plain of the wall joint.

Please confirm no gypsum board is required in plain of WJC4.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Refer to enclosed revised detail 2 on SKA-4079 (A1-8178) for material clarification.

Refer to enclosed revised Expansion Joint Schedule in SKA-4080 (A1-8178) to clarify that WJC4 occurs in the interior side and WJC3 occurs in the exterior side. The adjoining and infill material columns of Seismic Joint Schedule are revised to match Specification and details.

Enclosed page 13 of Specification 07 09 13 3.4 Paragraphs L and M are revised to match A1-8880.

P1-0391	Insulated Soffit References per A1-9603	Closed	08/22/2014	09/01/2014	09/03/2014	Potentially	☐

Specification Section 07 21 00 1.1 1 d indicates Specification Section 07 21 00 does not apply to parapets.

Several details (for example, Details 1 & 2/A1-7870) show insulation within parapets.

Please provide a specification for insulation shown within parapets.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Refer to attached sketch SKA-4056 for insulation type within parapet and to Specification Section 07 21 00 / 2.3 C for INS-3 description.

Specification Section 07 21 00 / 1.1 A is being revised as follows:

¿A. Section includes thermal insulation to limit thermal gains and losses at the following locations:

1. Building envelope, excluding the following locations:

a. Roof insulation specified elsewhere.

b. Doors.

c. Glazed assemblies. DELETED

d. Parapets. . DELETED

e. Louvers, except where blank-off panels occur.

f. Flexible Head and edge of Wall firestopping sealants and membrane.

g. Fire safing and smoke seals at slab edges. DELETED.

2. Beneath the suspended concrete floor slabs where indicated, including beneath the radiant floor heating system.

3. Elsewhere as indicated. DELETED¿

Specification Section 08 62 50 3.5
Sheet A1-8877
Specification Section 08 62 50 3.5 A 2

Specification Section 08 62 50 3.5 Tubular Daylighting Devices references Tubular H.O.G Protective Enclosure and Stainless Steel Surface Collar. Sheet A1-8877 does not identify these pieces.

In addition, Specification Section 08 62 50 3.5 A 2 references seismic angle braces and Structural drawings. Structural drawings do not identify these pieces.

Please provide details and structural information on Tubular H.O.G Protective Enclosures and Stainless Steel Surface Collars referenced in Specification Section 08 62 50 3.5.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

All these questions no longer apply, as the work of Specification Section 08 62 50 Tubular Daylighting Devices is hereby deleted.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0399	Revision of Referenced Specificaton Section 09 90 00	Closed	08/22/2014	08/22/2014	08/26/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Specification Section 09 21 16 1.6 E, Specification Section 09 90 00 (IFC Drawings for Main Package dated 3/31/14)

Specification Section 09 21 16 1.6 E references Specification Section 09 90 00.

Specification 09 90 00 is not part of the contract documents.

Please revise the referenced specification number.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 09 21 16 1.6 E is revised to reference Section 09 91 00 in lieu of Section 09 90 00, which does not apply.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0400	Portable Lighting Requirement per Specification Section 09 21 16 1.6 E	Closed	08/22/2014	09/01/2014	09/03/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Specification Section 09 21 16 1.6 E 3, Specification Section 09 21 16 1.6 E 5 (IFC Drawings for Main Package dated 3/31/14)

Specification Section 09 21 16 1.6 E 3 requires the trade subcontractor to provide portable lighting for the review of mock-ups under various light conditions for defects and improperly finished joints, trim, and screw heads.

Specification Section 09 21 16 1.6 E 5 indicates that the mock-ups will be used as a standard for the gypsum board work with the same finish for the Project.

No requirement is given elsewhere that portable lighting is required for providing various lighting conditions for inspection/punch prior to final acceptance by TJPA.

Please confirm no lighting for inspection/punch prior to final acceptance is required beyond the ambient lighting found in the area under review.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

No portable lighting is required for the punchlist review prior to final acceptance by TJPA, unless the punchlist review is required prior to the time permanent building lighting is in place and operational.

P1-0409	Drill Holes for the Birdwire System	Closed	08/22/2014	09/01/2014	09/04/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Specification Section 10 81 13 3.2 C 2 (IFC Drawings for Main Package dated 3/31/14)

Specification Section 10 81 13 3.2 C 2 indicates that the installer of the Birdwire System is to drill ¼¿ holes in the substrate for mounting.

These holes may void the warranty of the substrate, and create a possible point of water intrusion.

Please confirm this is acceptable, or revise specification to allow for installation with adhesive only.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Install system using mechanical fastening methods only, without the use of adhesives. Use aluminum or stainless steel clamps, brackets, clips and fasteners for installation as shown in the Contract Document details. Use stainless steel hose clamp with attached post when attaching to pipe or round structural sections where diameter allows (e.g. light poles). The mechanical fastening method shall not penetrate the substrate in a manner that creates water intrusion or voids the warranty of the substrate.

P1-0411	ACT Ceiling Type for Room 01223	Closed	08/22/2014	08/22/2014	09/03/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Sheet A1-9603 (ASI 119 dated 6/20/14)

Sheet A1-9603 of ASI 119 calls out the ceiling finish of Room 01223 as "ACT".

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed, all ceilings noted as ACT on schedule are ceiling type ACT-1.

See attached sketch.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Typically on the finish schedules, the type of ACT is called out (i.e. ACT-1).

Please confirm all ceilings called out on the finish schedule to be "ACT" are to be Ceiling Type ACT-1.

P1-0412 **AWP-1 Call Out per Specification Section 09 77 23** **Closed** **08/22/2014** **09/01/2014** **09/05/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Sheet A1-9606 (ASI 122 dated 7/23/14)
Sheet A1-9804 (ASI 118 dated 6/20/14)
Sheet A1-9601 (ASI 119 dated 6/20/14)

Sheet A1-9606 indicates that Specification Section 09 77 23 Acoustic Wall Treatment is identified on the finish schedules as AWP-1. AWP-1 does not appear on any of the finish schedules.

- Per A1-9804, Rooms B1232 and B1239 have AWP-1 on the walls.

- Per A1-9601, the wall finish of B1232 and B1239 is painted gypsum.

Please coordinate the finish schedule to show the rooms to receive Acoustic Wall Treatment.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

For Acoustic Wall Treatment AWP-1 call out, refer to attached SKA-4065.

For specifications of Fabric (FAB-2) to be used for the acoustic wall panel, see below: (to be included in the upcoming ASI-0127)

Section 09 77 23 Acoustical Wall Treatment 2.3. Material

B. Fabrics:

2. Acoustical panel fabrics, unbacked tackable fabric by one of the following:

a. Knoll

b. Mayer Fabrics (series: Basic)

c. Maharam Fabric.

3. Color: To be selected from manufacturer standard range of colors.

P1-0413 **Wall Protection Systems Locations per Specification Section 10 26 00** **Closed** **08/22/2014** **09/01/2014** **09/03/2014** **Potentially** ☐

Co-Author:

REQUEST:

REFERENCE: Detail 1/A1-9858 (IFC Drawings for Main Package dated 3/31/14)

A.) Detail 1/A1-9858 calls out for:
- HSS Post
- Column Baseplate secured to Structural Slab

Detail 1/A1-9858 indicates the structural information is located on the structural plans. Structural plans do not show this steel.

B.) Detail 3/A1-9858 calls for:
- Structural Lintel Beam
- Shear Plate welded to HSS and bolted to Lintel Beam
- Double Steel Angle spaced at every 3'-0" alternating sides

Detail 3/A1-9858 indicates the structural information is located on the structural plans. Structural plans do not show these elements.

Please provide the referenced structural information for steel members and attachment.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

For both A) and B) the Structural Drawings do show the requested information. Please refer to 4/S1-9100 issued with IFC Set dated 03/31/14.

Co-Author:

REQUEST:

Reference Note #8 C1-8001 - C1-8005 ASI 123

Note #8 on Civil drawing(s) 8001 - 8005 contains the following: "Contractor shall coordinate with PG&E via TJPA for service connection work prior to start of construction. Location of PG&E service point is undermined and subject to change."

Please provide clarity for the Trade Group bidders on how TJPA would like them to provide pricing, for this unknown element with an undetermined location and/or duration of time necessary for coordination.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0416	Finish Details for Landscape Drawings	Closed	08/26/2014	08/26/2014	09/01/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference A1-2870, S1-2310 and S1-3201 (IFC Main set)

Architectural drawing A1-2870 directs the contractor to the Structural drawings for information regarding the concrete finish elevations; Structural drawings S1-2310 & S1-3201 provide elevation for top of concrete at the train box only; landscaping drawings do not provide any finish information ¿ (see highlighted section) as this is not included in the landscaping.

Please provide information regarding the highlighted section on the attached drawing L1-2330 and/or drawing number wherein concrete sectional details can be found, including topping slab to concrete on grade. Provide details for elevations, expansion joints, contraction joints, landscaping if any, civil site work if any.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The area referred to and highlighted in this RFI is Parcel F. There is no Landscape or Civil Site Work scope in this area, as the finishing of this area is future work not within the current scope of the Transbay Transit Center project.

Note:

A1-2870 does not direct the contractor to the Structural drawings for concrete finish elevations.

S1-2310 has a few elevations, but that is a structural convention to illustrate a step in the slab. All elevations for the top of concrete Ground Floor level slab are derived from the Architectural slab edge drawings.

S1-3201 is a section, not a plan and there are no elevations shown on this drawing.

P1-0417	VE Item 4a	Closed	08/26/2014	09/05/2014	09/18/2014	Potentially	☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Transbay PMPC Ray Quesada

Co-Author:

REQUEST:

Reference all Landscaping drawings

Recently it was discussed that VE item number 4a (see attached); removal the banding at the topping slabs has been accepted by TJPA. Please provide new landscaping drawings and details with information to allow the bidders to incorporate this into their pricing.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The information on this VE item (4A) is the same as Alternate No. 26 listed on Specification Section 01 10 30/APE. Also refer to Specification Section 03 33 12, par. 3.16.C.

P1-0418 **Revision of Corrosion Engineer Requirement Anywhere Stated** **Closed** **08/28/2014** **09/07/2014** **09/08/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Specification Sections requiring a Corrosion Engineer

Specifications currently require a corrosion engineer to conduct a component-by-component analysis of potential corrosion and and provide the engineer's report.

Per discussions with TJPA, PMPC, and WOJV, the use of a corrossion engineer is no longer required.

Please confirm that all specification sections currently requiring a corrosion engineer will be removed and the only requirement is to provide the report as approved by the TJPA Representative.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Contractor is to provide a component-by-component corrosion analysis report with their own forces, rather than providing an analysis by a corrosion engineer, when a corrosion analysis is called for in the specifications.

It is believed the requirement for the corrosion analysis to be performed by a corrosion engineer has been removed from all specification sections. Please provide a follow-up RFI for any current specification sections you find with the requirement for a corrosion engineer.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0419	Application of Specification Section 01 80 50	Closed	08/28/2014	09/07/2014	09/14/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Specification Section 01 80 50 1.1 B (IFC Drawings for Main Package dated 3/31/14)

Specification Section 01 80 50 1.1 B states, "The requirements of this Section apply to all non-structural components, unless otherwise noted."

Per previous meetings with PMPC, 01 80 50 is to be specifically referenced in each specification to which it applies.

Please provide the areas and specification sections to which Specification Section 01 50 80 Seismic Design Criteria for Nonstructural Components applies.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 01 80 50 is revised to include this statement in the Summary:

"B. The requirements of this Section apply when adopted by reference by other Sections of the Specifications."

The Specification Sections listed below include nonstructural components requiring seismic criteria in their work, thus they will contain a reference to Section 01 80 50 Seismic design Criteria for Nonstructural Components.

- 07 09 13 - Seismic Joint Assemblies
- 07 09 15 - Vehicular Seismic Joint Assemblies
- 09 22 19 - non structural metal framing
- 09 24 00 - Portland Cement Plastering (W-18)
- 09 51 00 - Acoustic ceiling tiles
- 09 69 00 - Access Flooring
- 10 14 19 - Dimensional Lettering
- 10 14 26 - Pylon Signage
- 10 14 33 - Illuminated Panel Signage
- 10 14 36 - Non-Illuminated Panel Signage
- 10 14 66 - Floating Signage
- 10 14 83 - Interpretive Graphics
- 10 18 00 - Informational Kiosks
- 10 21 13 - Toilet partitions and screens
- 10 22 39 - Operable Partition

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

- 10 44 00 - Automatic smoke and fire curtains

- 10 51 13 - Metal lockers

Co-Author:

REQUEST:

REFERENCE: Details 4-8/A1-9060 (IFC Drawings for Main Package dated 3/31/14)

Details 4 - 8/A1-9060 indicate that the exposed wall space area above tile within the SFPD Restrooms are to be painted cement board.

Painting of exposed cement board is not a typical application.

Please confirm painted cement plaster board is desired where indicated in the contract documents, and provide finish/appearance required for the painted cement board.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

For the restrooms, cement board is used as a substrate for the tile finish. The wall area between the top of the tile and the ceiling is painted gypsum board. The annotation on the Lower Concourse Restroom elevations and the wall assembly annotation on the Partition Schedule have been updated accordingly. Please refer to the attached SKA-4070 to SKA-4074.

Co-Author:

REQUEST:

REFERENCE: Specification Section 09 24 00 1.1 C 2 (ASI 124 dated 8/18/14)

Per Specification Section 09 24 00 1.1 C 2 of ASI 124, the raceways, wiring, and pathways needed for concealed electrical systems i.e., lighting fixtures, exit lighting, power, way finding, automatic door power, along with low voltage wires (concealed or exposed as indicated in drawings are to be furnished by others, but installed by the Portland Cement Plaster Trade Package.

TG10.4 - Electrical, Communications, Security, and Integrated Networks, is to furnish and install all electrical work unless specifically referenced in other trade packages (for example, some low voltage is in the Doors and Hardware Trade Package).

Please remove installation of electrical out of the specification for Specification Section 09 24 00.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Paragraph 1.1 C.2 of Specification Section 09 24 00 issued on ASI-0127 is deleted, work is defined under TG10.4.

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author:

REQUEST:

REFERENCE: Note PA-1/S-0008, Note PA-3/S-0008 (IFC Drawings for Main Package dated 3/31/14)

Note PA-1/S-0008 defines a powder actuated fastener as a post installed anchor.

Note PA-3/S-0008 states to use scanning equipment or other means to locate and avoid cutting or damaging reinforcing bars.

Based upon these requirements, scanning for rebar will be required prior to the installation of any powder actuated fasteners (metal framing top and bottom tracks, ceiling wires, etc.).

This could significantly increase the cost and duration of the work. Please confirm scanning or other methods for locating rebar is required prior to the installation of powder actuated fasteners.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

If powder actuated fasteners are long enough to cause damage to rebar, then scanning per PA-3 is required. If the powder actuated fasteners are short enough not being able to hit or damage rebar, then section PA-3 is not invoked hence scanning is not required.

P1-0428	Portland Cement Plaster Color	Closed	08/28/2014	09/07/2014	09/15/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: Specification Section 09 24 00

Specification Section 09 24 00 2.7 B indicates that the cement plaster color is to be Gray. No other integral colors are noted.

If the cement plaster requires paint, the plaster will need to cure for an extended duration before paint is applied. This will impact the duration the scaffold is in place.

Please note that TG16.1 Drywall/Framing is currently scoped to leave the scaffold in place if the cement plaster requires painting.

Please confirm that the gray cement plaster is to remain exposed and does not require paint.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 09 24 00 paragraph 2.7 B has been revised. Please refer to attached markup of this section for revised plaster system and materials.

Issues related to curing times per specification are determined by the plaster system manufacturer's recommendations.

Please refer to paragraph 2.5 in the attached revised plaster Section. The color is integral to the pre-mixed exterior finish coat, which is applied over the plaster mesh over the brown coat. The basis of design specified is Parex "Image Smooth Finish" with a custom color - The color is BM 1548 classic gray to match TJPA's Representative sample.

The duration of the scaffold in place is a Means and Methods decision to be determined by the Contractor.

Reference A1-9606 (SKA-3884) ASI 122 (07/23/2014) and Specification 09 30 00 Section 3.9 IFC Main Set (03/31/2014)

A1-9606 calls out POR-3 base to be '3¿ high x 12¿ bullnose'. Specification 09 30 00 3.9 calls out the size as '4¿ x 12¿ bullnose'. These are in conflict. Please revise so that the drawing and the Specification are not in conflict.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Tiling specification Section 09 30 00 items 3.9.C is revised to match base height shown on drawing A1-9606. Refer to attached PDF of page 11 for updated information.

REQUEST:

Reference Specification Section 10 44 00 ASI 121 (07/18/2014)

Specification 10 44 00 section 1.1 A states that automatic smoke and fire curtains are at all elevator doors. The architectural and electrical drawings do not indicate that

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. No, not all elevators require Smoke and Fire Curtains at all levels. Refer to SKA-4107 for Elevator Matrix (matrix will be included in referenced specification in next ASI issue).
2. See below for specific Elevator Detail correction:

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

automatic smoke and fire curtains exist at all elevator doors. Please confirm if all elevator doors receive automatic smoke and fire curtains.

If yes, please revise: 1) the architectural elevator jamb/head details and/or detail callouts and, 2) coordinate revisions with the electrical drawings.

If no, please provide: 1) a matrix of the elevators that require automatic smoke and fire curtains and 2) revise architectural details and/or detail callouts. 3) coordinate revisions with the electrical drawings.

Please note the following coordination conflicts currently exist between the architectural and electrical drawings and should be addressed in the answers above:
-E1-2204 shows power for smoke curtains at elevators PE403 and PE404 but the architectural detail for the elevator does not show an automatic smoke and fire curtain at the door head/jamb. Coordinate and revise accordingly.

-The electrical drawings show power for smoke and fire curtains for Lower Concourse Passenger Elevators 301,302, 502, 503, 704 and 705 but the architectural detail for the elevator does not show an automatic smoke and fire curtain at the door head/jamb. In addition the door head/jamb details are for service instead of passenger elevators. Coordinate and revise accordingly.

-Electrical drawings show power for automatic smoke and fire curtains for PE202 on the ground level. Provide elevator door jamb detail for PE202 on the ground level that includes automatic smoke and fire curtain.

-PE403, PE404, PE502, PE503, PE704 and PE705 all have details that show a smoke and fire curtain on the ground level. Electrical drawings do not have power for smoke and fire curtains at these locations on the ground level. Coordinate and revise accordingly.

-PE403 and PE404 electrical drawings show power for automatic smoke and fire curtains on the second level however there is not a detail for the elevator jamb/head condition that shows the automatic smoke and fire curtain.

a) E1-2204 shows power for Smoke curtains at Elevators PE403 & PE404 at Lower Concourse Level, refer details 1 & 3 in SKA-4110.

b) For smoke and fire curtains for Lower Concourse Elevators 301, 302, 502, 503, 704 & 705, refer details 1 & 3 in SKA-4110.

c) For smoke and fire curtains for PE202 at Ground level, refer detail 2 & 4 in SKA-4110.

d) Smoke and Fire curtains removed at PE403, PE404, PE502, PE503, PE704 & PE705 at Ground level, refer detail 2 & 4 in SKA-4108 and 3 in SKA-4109.

e) Refer to sheet A1-7832 - Addendum # 4 06/20/14, for smoke & fire curtains at PE403 & PE404 at second floor.

f) Reference on 3/A1-7204, revised to 4/A1-7832, refer to SKA-4111.

g) Refer to sheet A1-7840 - Addendum # 4 06/20/14, for smoke & fire curtains at PE302, PE303, PE502 & PE503 at Bus deck.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Coordinate and revise accordingly.

-PE704 and PE705 3/A1-7204 references 4/A1-7830 which is regarding stair 501 and not PE704 and PE705. Revise callout for the elevator jamb/head condition for the second level.

-PE302, PE303, PE502, and PE503 provide detail of elevator jamb/head condition, electrical drawings show an automatic smoke and fire curtain on the bus deck level for these elevators however there are not details for that.

P1-0440 **Access Hatch per Detail 4/A1-9220** **Closed** **09/08/2014** **09/18/2014** **09/14/2014** **Potentially** ☐

Co-Author:

REQUEST:

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)
Specification Section 08 31 20 1.1 A
Detail 4/A1-9220

Specification Section 08 31 20 1.1 A Floor Doors references "single-leaf floor doors at water tanks."

Detail 4/A1-9220 illustrates a single-leaf door to be installed at the Train Platform Level Water Storage Tank but calls out "Access Hatch". There are no specifications for Access Hatches.

Please confirm Specification Section 08 31 20 Floor Doors is to be used for all single-leaf doors/access hatches/openings at water tanks or provide an Access Hatch specification.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 08 31 20 Floor Doors are to be used for all single leaf floor doors at the water tanks. For updated drawing annotations for the water tank floor doors, refer to SKA-4095 and SKA-4096.

P1-0456	**LEED Credit MR5 for Terrazzo**	**Closed**	**09/11/2014**	**09/11/2014**	**09/24/2014**	**Potentially**	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference Specification Section 09 66 23 1.5.C IFC Main Set (03/31/2014)

09 66 23 1.5.C calls out for LEED Credit MR 5, which requests information on the terrazzo's materials extraction, processing and location of manufacture. No specific aggregates have been specified for this scope of work. Please confirm there is no minimum amount of material for 09 66 23 which must be extracted, processed and manufactured within the straight-line total travel distance described in 09 66 23 1.5.C.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

LEED requirements are a goal, which cannot be confirmed until the final colors have been approved by the Artist in collaboration with TJPA and the Awarded Subcontractor.

P1-0457	Fl Requirements for Terrazzo	Closed	09/12/2014	09/22/2014	11/19/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference Specification Section 03 30 02, 09 66 22, 09 66 23 IFC Main Set (03/31/2014)

03 30 02 3.6.A.2 states to comply with dimensional tolerance limitations given by ACI 117 for Concrete Finishes, and 03 30 02 3.6.A.4.c states "Fl numbers shall not apply to unshored slabs or shored slabs with camber." ACI 117 4.4.1 states that slabs on structural steel or precast concrete have no deviation from elevation requirement. However, 09 66 22 3.2.B states that the Terrazzo Trade Subcontractor must level the floor to a specific Fl, and 09 66 23 3.3.F refers to 09 66 22 3.2.B for Fl requirements for Epoxy Terrazzo Flooring. As such, the concrete filled metal pan deck and topping slabs have a Fl requirement which conflicts with the allowable Fl referenced in 09 66 22 and 09 66 23. In addition, the concrete substrate may continue to move after installation of terrazzo. Please provide direction on installation of terrazzo epoxy crack suppression and epoxy terrazzo flooring where their Fl requirements conflict with the Fl requirements of the concrete substrate.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 09 66 22, 3.2 B: Reference to tolerances is to be removed from this section.

Specification Section 09 66 22, 3.2 C to be revised as follows: Before installation of the moisture control system, engage a California licensed surveyor or civil engineer to make a survey of the floor to confirm the flatness SOFf of 50 and elevations as indicated on drawings using a self propelled profilometer or a similar instrument that will give an accurate measurement downloadable to a computer in the form of a floor survey. Report any deviations from the floor flatness criteria or floor level to General Contractor for correction.

Specification section 03 30 02, 3.6 G: Revise section to add 3. Finish surface of topping slab to SOFf of 50. Elevation of topping slab to be as shown on drawings.

To facilitate installation of reinforcing in topping slab at Grand Hall and to mitigate conflict with Hydronics Piping substitute #4 bar with WWR 6x6x4.5/4.5 on bolsters. WWR to be flat sheet.

P1-0462 **Thickness Requirement for Insulation or Topping Slab** **Closed** **09/17/2014** **09/27/2014** **09/29/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)
Sheet A1-2980
Detail 2/A1-2982
Specification Section 07 21 00 2.3 B
Details 4 & 5/A1-9321 (ASI 123 dated 3/31/14)

1.) Expanded Polystyrene Insulation (INS-2) is called for on Sheet A1-2980 at the Lower Concourse Level and Detail 2/A1-2982 at the Grand Hall. The sheet notes refer to Specification Section 07 21 00 for additional information on insulation types. Specification Section 07 21 00 2.3 B states "thickness as indicated".

2.) Details 4 & 5/A1-9321 call for insulation at the Bus Deck Level.

Plans and sections do not show the thickness of the the slab or insulation at the Lower Concourse Level, Grand Hall, or Bus Deck Level.

Please provide the thickness required for the insulation or topping slab to be installed at the Lower Concourse Level, Grand Hall, and Bus Deck Level.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Insulation thickness is 1" at lower concourse level and is located below concrete topping. Refer to SKA-4143 (based on A1-2980).

2. Plans and sections show extent of insulation and tag insulation types. For Grand Hall and Bus Deck levels refer to SKA-4174 (based on A1-9585) for concrete topping thicknesses and insulation thicknesses. As the Bus Deck insulation thickness varies, also refer to Slab Edge Plans for elevations of sloped built-up and sloped structural slab to calculate insulation thickness at various locations.

P1-0463	Topping Slab Requirements for Rooms B1365, B1387, B1390	Closed	09/17/2014	09/27/2014	09/24/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: (ASI 121 dated 7/18/14)
Sheet A1-2203
Sheet A1-9523

Sheet A1-2203 refers to Sheet A1-9523 for Slab Topping Details for rooms B1365 (Oversized Equipment Storage), B1387 (Maintenance Equipment Repair Shop), and B1390 (Maintenance Workshop).

Sheet A1-9523 does not require traffic rated topping slabs for rooms B1365, B1387, or B1390. However, these rooms are indicated for the use of oversized equipment storage and maintenance.

Please confirm rooms B1365 (Oversized Equipment Storage), B1387 (Maintenance Equipment Repair Shop), and B1390 (Maintenance Workshop) are not to receive traffic rated topping slabs.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The structural engineer has confirmed that the topping slab assembly in rooms B1365 (Oversized Equipment Storage), B1387 (Maintenance Equipment Repair Shop), and 1390 (Maintenance Workshop), described on A1-9523 (Note# 1), is sufficient to receive the anticipated the loads of the equipment traffic.

Reference Specification Section 32 11 24 2.1.A, 2.2.A IFC Main Set (03/31/2014)

Specification says that 100% of materials are to be sourced regionally. The Geotextile Fabric manufacturer listed in this Specification is from Georgia, which would cause great difficulty in achieving this credit. Please revise the Specification so that the LEED credit is achievable with the given manufacturers.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The manufacturers global headquarters is in Georgia. Contact manufacturer to confirm local fabrication plant.

P1-0483	Recycled Content Requirements	Closed	09/23/2014	10/03/2014	10/21/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference Specification Section 32 11 24 2.1.A IFC Main Set (03/31/2014)

Recycled content submittal requirements are included in Part 1. Since there is no LEED MRc4 requirement listed in section 2.1, confirm that there are no recycled content requirements.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

No minimum recycled content is required for the subject specification. Only a LEED data submittal is required.

REQUEST:

Reference Specification Section 32 01 90 1.5.B and 2.1.A IFC Main Set (03/31/2014)

In Specification 32 01 90 1.5B and 2.1.A, MRc5 Option 2 is not listed. The LEED language in this Specification needs to match Specification 01 81 13. Please revise 32 01 90 to add MRc5 Option 2.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Language has been changed to option 2 in both 1.5.B and 2.1.A. See attached SKLA-332.

P1-0485	2 Year Maintenance Period After Final Completion	Void	09/23/2014	10/03/2014		Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:**

Co-Author:

REQUEST:

Reference Specification Section 32 01 90 3.2.A IFC Main Set (03/31/2014)

Specification states "Continuously maintain plants, planted areas, and irrigation system during progress of Work, and for a minimum period of 2 years after date of Final Completion and until the TJPA accepts maintenance responsibility." Confirm that TJPA wants to bid the 2 year maintenance period after Final Completion.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

P1-0486	Maintenance Fertilization Program	Closed	09/23/2014	10/03/2014	10/31/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference Specification Section 32 01 90 2.2.C IFC Main Set (03/31/2014)

Clarify where the details of "the maintenance fertilization program accepted by the TJPA Representative" may be found. Please provide all details of the "maintenance fertilization program."

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The "maintenance fertilization program" will be established based on the existing site conditions at the beginning of the maintenance period and be determined based on the informational submittals as identified in 32 01 90 1.4.

Existing site conditions will be based on the approved and installed soil blends, additives, fertilizers, amendments, etc. though the construction period.

The informational submittals shall be provided to the

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

TJPA representative for review and comment. Based on these submittals the "maintenance fertilization program" will become established though the Maintenance Period.

P1-0487 **Maintenance Period Charges** **Void** **09/23/2014** **10/03/2014** **Potentially** ☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:**

Co-Author:

REQUEST:

Reference Specification Section 32 01 90 3.9.B.2 IFC Main Set (03/31/2014)

Specification states "Continue maintenance of landscape Work until the date that the TJPA accepts maintenance responsibility." Confirm that for pricing, the trade subcontractor should include two years worth of maintenance and then a monthly fee will be charged for any time period extending beyond the two years. Confirm if the acceptance of TJPA maintenance responsibility will be in writing.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

P1-0488 **MRc5 Option 2 Language** **Closed** **09/23/2014** **10/03/2014** **11/21/2014** **Potentially** ☐

Co-Author:

REQUEST:

Reference A1-8520 (ASI 124)

Details 1, 2, and 4/A1-8520 show the connection of the W-14 ceilings and the cast nodes. There is no detail or information provided for the reveal between the W-14 and the cast nodes. Please provide a cut that shows this reveal detail.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The aluminum ceiling portion of this project is treated as Design/Build; the design intent is shown and profiles are diagrammatic in nature, thus not all conditions are detailed; additionally, the ceiling reveals illustrated in details 1, 2 & 4 on A1-8520 occur at angled pipe columns, not at cast nodes.

As noted in the W-14 System Description on A1-8500, dimensional control for the joints between W-14 ceilings and adjacent systems shall be derived from the 3D model. Refer to the W-14 3D model listed on sheet A1-0009.

Co-Author:

REQUEST:

Reference ASI 124 Drawings

The following sheets show a new W-14 Metal Ceiling location, without deleting the old rigid insulation location: 2/A1-8501, 3/A1-8510, 1/A1-8511, 1/A1-8530, 4/A1-8530, 5/A1-8530, 9/A1-8530, 4/A1-8531, 3/A1-8532, 5/A1-8532, 7/A1-8532. Additionally, the following sheets do not show rigid insulation redrawn with the new redline markups: 2/A1-8501, 5/A1-8510, 1/A1-8511, 1/A1-8521. It seems that there was no intent to place rigid insulation above horizontal or diagonal soffit locations.

a) Please confirm there is no rigid insulation located above horizontal or diagonal soffits.

b) Please revise these drawings so that the rigid insulation is properly located, and so that all old rigid insulation locations are deleted.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

a) Acoustical insulation is required at all corrugated ceiling panels to mee the criteria in Specification 09 51 23 2.4 Q. Acoustical insulation is required at horizontal, sloped or vertical soffits to meet said criteria.

b) Per TJPA's direction, all of the Conformed IFC Documents with the revised construction documentation will be issued in the Conformed Set of December 2014.

REQUEST:

REFERENCE: (ASI 127 dated 9/12/14)
Specification Section 10 14 16
Specification Section 10 14 19
Specification Section 10 14 26
Specification Section 10 14 33
Specification Section 10 14 36
Specification Section 10 14 63
Specification Section 10 14 66
Specification Section 10 14 73
Specification Section 10 14 83
Specification Section 10 18 00

The following Specification Sections require bidders to "employ workers that will be employed during the construction at the Project.":

- Specification Section 10 14 16 1.3 E 3 Cast and Etched Graphics
- Specification Section 10 14 19 1.3 E 3 Dimensional Lettering
- Specification Section 10 14 26 G 3 Pylon Signage
- Specification Section 10 14 33 1.3 F 3 Illuminated Panel Signage
- Specification Section 10 14 36 1.3 E 3 Non-Illuminated Panel Signage
- Specification Section 10 14 63 1.4 J 3 Electronic Panel Signage
- Specification Section 10 14 66 1.4 G 3 Floating Signage
- Specification Section 10 14 73 1.3 F 3 Glass Signage
- Specification Section 10 14 83 1.4 E 3 Interpretive Graphics
- Specification Section 10 18 00 1.4 H 3 Informational Kiosks

Subcontractors will not be able to guaranty employment of specific workers producing material. Please confirm it is acceptable that personnel may change throughout the project.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

· Specification Section 10 14 16 1.3 E 3 Cast and Etched Graphics: Delete in its entirety, sentence 10 14 16 1.3 E 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.

· Specification Section 10 14 19 1.3 E 3 Dimensional Lettering: Delete in its entirety, sentence 10 14 19 1.3 E 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.

· Specification Section 10 14 26 1.4 G 3 Pylon Signage: Delete in its entirety, sentence 10 14 26 1.4 G 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.

· Specification Section 10 14 33 1.3 F 3 Illuminated Panel Signage: Delete in its entirety, sentence 10 14 33 1.3 F 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.

· Specification Section 10 14 36 1.3 E 3 Non-Illuminated Panel Signage: Delete in its entirety, sentence 10 14 36 1.3 E 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.

Detail 2/SG1-6023 (IFC Drawings for Main Package dated 3/31/14)

Key Note 9 on Detail 2/SG1-6023 indicates that the final artwork for Sign KM1 Static Map and Digital Display is to be supplied by owner.

Please provide the final artwork, information on amount of letters to be priced, or allowance amount to be used.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The detailed configuration of the Transit Center ¿ specific to all interior spaces and uses -- has not yet been finalized. Consequently, artwork for the final graphic for the static map is not yet available. Pricing can be based on the assumption that the final static map will be a large format digital print map of the Transit Facility, fabricated and installed as per the current drawings and specifications. There is no ¿Dimensional Lettering¿ as a component of this sign type.

P1-0526	Graphic Requirements for Sign AC1 per Detail 6/SG1-6201	Closed	10/10/2014	10/20/2014	10/17/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Detail 6/SG1-6201 (IFC Drawings for Main Package dated 3/31/14)

Detail 6/SG1-6201 shows a blank rectangle at the top of Sign AC1 Art Commission Plaque. No information has been given as to inserting a graphic in the rectangular space.

Please confirm no graphic is to be provided within the blank rectangular space at the top of Sign AC1, or provide the required graphic.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The rectangular space indicated on Detail 6/SG1-6201 is reserved for an illustration of the future artwork that the plaque will identify (to be reversed etched as with the rest of plaque). Final illustration ¿ available at a future date ¿ is to be provided by artist through Sign Subcontractor, and approved by TJPA. For pricing purposes, bidder should assume rectangular space will be filled with reverse etched illustration.

Co-Author:

REQUEST:

REFERENCE:
Specification Section 10 14 26 (ASI 127 dated 9/12/14)
Details 6 & 7/SG1-6001 (IFC Drawings for Main Package dated 3/31/14)

Specification Section 10 14 26 3.1 Pylon Signage directs that the signage subcontractor is to verify that electrical power is sized and located to accommodate signs. In addition, Details 6 & 7/SG1-6001 indicate that the signage contractor is to provide power requirements to the TJPA representative.

Per Constructability Comments 7909, 7910, and 7911, the signage specification are to be revised to require the signage contractor to design the signs within the electrical circuiting power allotments in the current design, and include additional electrical circuits in their signage bid if additional power is determined to be required.

Please revise Specification 10 14 26 as indicated in the response to Constructability Comments 7909, 7910, and 7911.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

As per the RFI and Constructability Comments 7909, 7910, and 7911, Specification Section 10 14 26 3.1 B, Pylon Signage, has been modified as follows: Delete the sentence ¿Verify that items, including anchor inserts, and electrical power are sized and located to accommodate signs.¿ in its entirety and replace with the sentences, ¿Verify that anchor and anchor inserts are sized and located properly to accommodate installation of Pylon signage. Sign Subcontractor to design signs to conform to electrical circuiting power allotments existing in the current design and if necessary, include additional electrical circuits in pricing if additional power is determined to be required.¿ See attached.

REQUEST:

REFERENCE:
Detail 3/SG1-6003 (IFC Drawings for Main Package dated 3/31/14)

Per Key Note 9 on Detail 3/SG1-6003, Sign Type PD1 Bus Deck Dock Identification and Sign Type PD2 Muni Plaza Identification are to be provided with a GFIC duplex outlet.

Sheet E1-2306 and Sheet E1-2502 through Sheet E1-2507 do not show outlets or circuiting for outlets at these locations.

Please confirm no outlets are required at these locations, or provide circuiting information.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

WSP Response:

15A convenience outlets will be added within signage pylons for the following sign types:

PS1

PS2

PS4

PS5

PS6

PD1

PD2

These convenience outlets will be connected to existing spare 20A circuit within nearby LP panel, no more than 8 outlets per circuit. Outlets are being provided by signage contractor. Refer to future ASI 0128 drawings for circuiting info.

WRNS Response:

We have confirmed that outlets are required as indicated for Sign Types PD1 and PD2. See associated, revised Electrical Drawings for outlets and circuiting.

Reference 13 34 24 (ASI 127)

The Contract Documents do not dimension the exterior window glazing for the Prefabricated Guard Booths. Please dimension the exterior window glazing before bid so that this package can be accurately priced.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Prefabricated booths are design-build elements. To realize the maximum design-build value, Design Team will rely on the booth manufacturer's standard fabrication modules.

Specification section 13 34 24, 2.3.H, shall be modified as follows:

2.3.H.

1. Maximize window size for all non-restroom spaces within manufacturer's standard module/panel size.

2. Window sill shall clear built-in work counter height, and be located between 2'-8" and 3'-0" above finished floor.

3. Window head height shall not exceed booth ceiling height.

4. Minimum window height shall not be less than 3'-6", and width of window is to suite manufacturer's building module.

5. Window framing system shall consist of continuous galvanized steel interior and exterior retainer along window perimeter used to secure window glazing.

Detail 2/SG1-6190 (IFC Drawings for Main Package dated 3/31/14)
Signage Plan Sheets (IFC Drawings for Main Package dated 3/31/14)
Sign Message Schedule (ASI 127 dated 9/12/14)

Signage Plan Sheets call out Sign Type CT1 at multiple locations. Detail 2/SG1-6190 calls for Sign Type CT1 Clipper Tag on Elevator.

The Sign Message Schedule indicates that Message A for Sign Type CT1 is to be determined. This is not biddable with the current information.

Please provide the verbiage for Sign Type CT1 at all locations shown on the Signage Plan Sheets, information on amount of letters to be priced, or allowance amount to be used.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The message for Sign Type CT1 is integrated with the ¿Clipper Tagging¿ device and is part of the vendor-supplied system to be bought-out separately by TJPA. The Sign Subcontractor would be responsible only for its installation and integration within the pylons and wall surfaces in which the devices are designated to be installed. See attached revised Signage Message Schedule.

REQUEST:

REFERENCE:
Sign Message Schedule (ASI 127 dated 9/12/14)

The Sign Message Schedule states the following for Sign Type ST1 Floor Level ID:
"Verify stair information with contractor prior to fabrication"

For examples, see the following pages in the Sign Message Schedule:
Pg. 1: Sign ST1-T-02-007
Pg. 5: Sign ST1-L-02-0214
Pg. 11: Sign ST1-G-02-005
Pg. 28: Sign ST1-G-10-002

Please provide the omitted information to be "verified".

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specific to Sign Type ST1, please see revised Sign Message Schedule, attached. The specific text for the messages on each of the referenced "Sign Type ST1" cannot be finalized until each individual exit stair function and operation is also finalized, as information for each stair and floor level will vary (e.g., levels accessed/not accessed, re-entry information, etc.). Pricing can be based on the General Sheet Notes, Key Notes, and the example of text/graphics indicated on Detail 3/SG-6200 text example, as well as on the associated specifications.

REQUEST:

REFERENCE:
Specification Section 10 14 83 (ASI 127 dated 9/12/14)

Specification Section 10 14 83 2.4 G Interpretive Graphics states that signage development is independent of schedule, and to allow adequate time for development of product.

The signage subcontractor will be required to complete the work as required by the construction schedule.

Please remove the schedule language associated with 10 14 83 2.4 G.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 10 14 83 2.4 G, Interpretive Graphics, delete in its entirety the sentences ¿Signage development is independent of schedule. Allow adequate time for development of product.¿ See attached.

P1-0570 **Drawings for Interpretive Graphics** **Closed** **10/16/2014** **10/26/2014** **10/22/2014** **Potentially** ☐

Co-Author:

REQUEST:

REFERENCE:
Specification Section 10 14 83 (ASI 127 dated 9/12/14)

Specification Section 10 14 83 3.3 A Interpretive Graphics directs that the signage subcontractor is to locate signs and accessories where indicated.

No drawing has been provided locating the interpretive graphics. Please provide a document laying out the interpretive graphics.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Roof Park Garden layout ¿ where the Interpretive Graphics elements will be installed ¿ has not yet been finalized. Consequently, final locations for these elements cannot be identified at this time. Pricing should be based on the information contained in the Signage Drawings and associated specifications (e.g., nature of construction/fabrication, quantities, installation methodologies, etc.). Regarding Specification Section 10 14 83 3.3 A, Interpretive Graphics, delete in its entirety the sentence ¿Locate signs and accessories where indicated, using mounting methods of types described and complying with manufacturer's written instructions.¿ and replace with the sentence ¿Signs and accessories to be installed using mounting methods of types described and complying with manufacturer's written instructions.¿ See attached.

REQUEST:

REFERENCE:
Specification Section 10 14 83 (ASI 127 dated 9/12/14)

Specification Section 10 14 83 2.1 A 1 a Interpretive Graphics states that the thickness of aluminum for interpretive graphic signage is per the construction intent drawings.

The construction intent drawings do not show a thickness. Please provide the thickness of aluminum for the interpretive graphic signage.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 10 14 83 has been modified to remove the term ¿Construction Intent¿ (as in ¿construction Intent Drawings¿), which has been replaced with the term ¿Signage¿ (as in ¿Signage Drawings¿). See attached.

Specific to Specification Section 10 14 83 2.1 A 1 a, Interpretive Graphics, the thickness of aluminum for the Interpretive Graphic Signage is ¼¿, as indicated on Key Note #1, Sheet SG1-6080.

P1-0572	**Correction of Fahrenheit to Celsius Calculation in Specification Section 10 18 00**	**Closed**	**10/17/2014**	**10/27/2014**	**10/21/2014**	**Potentially**	☐

Detail 1/SG1-6020 does not show a lockable access port on Sign Type KC1 Combined Touchscreen & Digital Display. In addition, electrical plans do not call out a

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

It is confirmed that Sign Types KC1, KM1, KP1, KP3, KT1, and KT2 are to be on switchable lighting circuits. The requirement that they have a GJCI duplex power outlet, 120V, concealed in a lockable access port on a convenience power circuit has been eliminated as per the revised Specification Section 10 18 00. See attached.

Specification Section 10 18 00 2.2 C 1 v, Informational Kiosks (Sign Type KC1), delete in its entirety the sentence, ¿GFIC duplex power outlet, 120V, concealed in a lockable access port on a convenience power circuit.¿
Specification Section 10 18 00 2.2 D 1 s, Informational Kiosks (Sign Type KM1), delete in its entirety the sentence, ¿GFIC duplex power outlet, 120V, concealed in a lockable access port on a convenience power circuit.¿
Specification Section 10 18 00 2.2 E 1 r, Informational Kiosks (Sign Type KP1), delete in its entirety the sentence, ¿GFIC duplex power outlet, 120V, concealed in a lockable access port on a convenience power circuit.¿
Specification Section 10 18 00 2.2 E 2 r, Informational

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

separate circuit for a convenience outlet, and lighting plans do not call out for a switchable lighting circuit (ex. E1-2302 and E1-4302).

Please coordinate the electrical and signage requirements for sign types specified in Specification Section 10 18 00.

Kiosks (Sign Type KP3), delete in its entirety the sentence, ¿GFIC duplex power outlet, 120V, concealed in a lockable access port on a convenience power circuit.¿
Specification Section 10 18 00 2.2 F 1 s, Informational
Kiosks (Sign Type KT1), delete in its entirety the sentence, ¿GFIC duplex power outlet, 120V, concealed in a lockable access port on a convenience power circuit.¿
Specification Section 10 18 00 2.2 F 2 t, Informational
Kiosks (Sign Type KT2), delete in its entirety the sentence, ¿GFIC duplex power outlet, 120V, concealed in a lockable access port on a convenience power circuit.¿
In addition and under this RFI, a revision was made to:

Specification Section 10 18 00 2.3 A, Informational
Kiosks, delete the words, ¿or lead¿.
All circuits serving sign types KC1, KM1, KP1, KP3, KT1, and KT2 shall be via emergency power LRC to be located in same electrical room as power panel serving sign. Provide separate cabinet and quantity of relays to match quantity of circuits served.

WSP/ELW 10/23/14

P1-0580 **Ticket and Added Value Machine Information** **Open** **10/17/2014** **10/27/2014** **Potentially** ☐

Co-Author:

REQUEST:

REFERENCE:
Specification Section 10 18 00 (ASI 127 dated 9/12/14)

The following Specification Sections indicate that the ticket and added value machines are not in the contract, but the signage contractor is to coordinate with the machine manufacturer for power, dimensions and support structure:

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

10 18 00 2.2 F 1 n
10 18 00 2.2 F 1 o
10 18 00 2.2 F 2 n
10 18 00 2.2 F 2 o

In addition, final quantities are to be determined by the TJPA representative.

Please provide the manufacturer of the ticket and added value machines, and final quantities for the machines.

P1-0581 **Power Requirements for Ticket and Added Value Machines** **Open** **10/17/2014** **10/27/2014** **12/09/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Specification Section 10 18 00 (ASI 127 dated 9/12/14)

The following Specification Sections indicate that the ticket and added value machines have separate power requirements from the associated kiosks:

10 18 00 2.2 F 1 n
10 18 00 2.2 F 1 o
10 18 00 2.2 F 2 n
10 18 00 2.2 F 2 o

Electrical drawings do not show separate power for the ticket and added value machines.

Please confirm no additional circuits are required for the ticket and added value machines, or revise the electrical documents to reflect the desired power and data requirements.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Circuiting has been provided on the electrical drawings based on a preliminary estimate of power allocation for signage components. No electrical changes are proposed at this time. Per the signage drawings, signage contractor must confirm all power requirements on system submittals. In addition, the ticket machine power requirements need to be confirmed. When this info is provided, if additional power is required, wiring can be pulled in the existing conduits.

UPDATE: Please see response to RFI PI-0530.

Co-Author:

REQUEST:

REFERENCE:
Sign Message Schedule (ASI 127 dated 9/12/14)

The messages for PD2-G-06-016 have an open quotation mark. Message B and Message D currently reads: MUN-2, 38 Geary, 38L Geary Limited".

Please confirm the message as shown is correct or provide the correct message.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed that message is correct. The open quotation mark for sign location PD2-G-06-016 has been deleted. Refer to the attached revised sign Message Schedule.

P1-0591	**Route Information for Sign Type PD2 Muni Plaza Bus ID**	**Closed**	**10/21/2014**	**10/31/2014**	**11/06/2014**	**Potentially**	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Sign Message Schedule (ASI 127 dated 9/12/14)
Detail 4/SG1-6003 (IFC Drawings for Main Package dated 3/31/14)

In multiple locations, it is indicated that final route information for Sign Type PD2 Muni Plaza Bus ID is to be provided by TJPA (ex. PD2-G-06-014).

Detail 4/SG1-6003 does not show any layout information for the referenced route information.

Please provide the referenced information and the layout for that information.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Confirmed that there is no ¿Route Information¿ for Sign Type PD2 that will need to be produced by the Sign Subcontractor. Route information ¿ to be finalized by MUNI/TJPA -- is to be displayed electronically on display screen(s) and will be produced by others.

Co-Author:

REQUEST:

REFERENCE:
Detail 3/SG1-6003 (IFC Drawings for Main Package dated 3/31/14)

Key Note 14 of Detail 3/SG1-6003 indicates that applied vinyl graphics are specified per Muni¿s requirement.

Please provide Muni¿s requirement.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

TJPA to provide color specifications for vinyl graphics when finalized. Keynote 14 of Detail 3/SG1-6003 has been revised accordingly. Refer to the attached SKSG-2007.

R. Quesada: SFMTA will provide an electronic file to the successful bidder to produce the applied vinyl graphics.

P1-0594 **Accessible Variants for Sign Types KT1 and KT2** **Closed** **10/21/2014** **10/31/2014** **10/28/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Detail 2/SG1-6021 (IFC Drawings for Main Package dated 3/31/14)

Detail 2/SG1-6021 identifies an accessible variant for Sign Type KT1 Ticket Vending Kiosk and Sign Type KT2 Ticket Vending Kiosk with Digital Display.

The signage plan sheets do not identify locations for the accessible variants required at Sign Types KT1 and KT2.

Please confirm no accessible variants at Sign Types KT1 and KT2 are required, or provide the locations of the accessible variants.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Sign location plans have been revised to locate ¿accessible variants¿ (one adjacent to each point of vertical circulation connecting to the bus deck). See attached SKSG #¿s 2008, 2009, 2010, & 2011.

REQUEST:

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)
Color/Font/Material/Symbol/Icons Report
Detail 4/SG1-6001

Per the Color/Font/Material/Symbol/Icons Report, Materials M8 and M13 require painting in some locations (Sign Types PS4 Rooftop Directional Pylon Sign with Exit Sign and RR4 Restroom Signage for example).

While colors are provided, no specification for painting of the signs has been provided (i.e. multiple manufacturers, mil thickness, prep requirements, etc.).

Please provide a specification (including light enhancing paint called out on Key Note 3C on Detail 4/SG1-6001) for signage to receive paint.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Paint, where indicated on Signage Drawings, has been addressed in the following specification revisions:

· Specifications Section 10 14 19 2.1 C, Dimensional Lettering Signage, add ¿C¿, ¿Paints and Coatings: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposures indicated.¿

· Specifications Section 10 14 19 2.6 C, Dimensional Lettering Signage, add ¿C¿, ¿Baked Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer¿s written instructions for cleaning, conversion coating, and applying and baking finish.¿

· Specifications Section 10 14 19 2.7 A 7 b, Dimensional Lettering Signage, delete in its entirety,

¿ : Spraylat Star-Brite White EF as manufactured by Spraylat Corporation (914-738-1600, http://www.spraylat.com) or equal.

1) Spraylat Star-Brite White EF as manufactured by Spraylat Corporation (914-738-1600, http://www.spraylat.com) or equal.

2) Matthews Paint 281 500SP High Reflective White 1.800.323.6593

3) Polar White as manufactured by Prismatic Powders 1.866.774.7628

4) Or equal . . . 1¿

and replace with the words, ¿manufacturer¿s standard white reflective paint.¿

· Specifications Section 10 14 19, Dimensional Lettering Signage, throughout the specifications section, remove the words ¿Construction Intent¿ and replace with the word, ¿Signage¿.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

· Specifications Section 10 14 66 2.1 A 7, Floating Signage, add ¿7¿, ¿Paints and Coatings: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposures indicated.¿

· Specifications Section 10 14 66 2.7, Floating Signage, add the following:

¿ 2.7 ALUMINUM FINISHES

A. Color Anodic Finish: AAMA 611, Class I, 0.018 mm or thicker.

B. Baked Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer¿s written instructions for cleaning, conversion coating, and applying and baking finish.¿

· Specifications Section 10 14 66, Floating Signage, throughout the specifications section, remove the words ¿Construction Intent¿ and replace with the word, ¿Signage¿.

· Specifications Section 10 14 26 2.1 A 5, Pylon Signage, add ¿5¿, ¿Paints and Coatings: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposures indicated.¿

· Specifications Section 10 14 26 2.7, Pylon Signage, add the following:

¿ 2.7 ALUMINUM FINISHES

A. Color Anodic Finish: AAMA 611, Class I, 0.018 mm or thicker.

B. Baked Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer¿s written instructions for cleaning, conversion coating, and applying and baking finish.¿

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

· Specifications Section 10 14 26 2.6 B, Pylon Signage, delete in its entirety the sentence, ¿Directional Satin Finish: No. 4 finish, horizontal¿.

· Specifications Section 10 14 33 2.1 A 5, Illuminated Panel Signage, add ¿5¿, ¿Paints and Coatings: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposures indicated.¿

· Specifications Section 10 14 33 2.7, Illuminated Panel Signage, add the following:

¿ 2.7 ALUMINUM FINISHES

C. Color Anodic Finish: AAMA 611, Class I, 0.018 mm or thicker.

D. Baked Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer¿s written instructions for cleaning, conversion coating, and applying and baking finish.¿

· Specifications Section 10 14 33, Illuminated Panel Signage, throughout the specifications

P1-0602	**Unidentified Icons per Sign Message Schedule**	**Closed**	**10/21/2014**	**10/31/2014**	**11/13/2014**	**Potentially**	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)
Color/Font/Material/Symbol/Icons Report

The Sign Message Schedule calls out for Icons not identified on the Color/Font/Material/Symbol/Icons Report (PS6-G-05-022 calls for Icons ASU-1, ACT-2 and ARU-1 for example).

Please coordinate all of the icons called out on the Sign Message Schedule with the information provided on the Color/Font/Material/Symbol/Icons Report.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Icon layouts for Sign Types PS2, PS5, PS6 have been revised to accommodate a maximum of 7-8 icons, depending on the specific message. See SKSG #2037, attached. Icon layouts for Sign Type PS4 has been revised to accommodate a maximum of 8 icons. See SKSG #2038, attached.

See the attached revised sign Message Schedule for sign Types PS1, PS2, PS4, PS5 and PS6. Additional pages of the Sign Message Schedule (reflecting no changes ort revisions) have also been attached for reference.

P1-0603	**Clipper Tagging Devices for Sign Type PS6 Interior Directional Pylon with Clipper**	**Closed**	**10/21/2014**	**10/31/2014**	**10/29/2014**	**Potentially**	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Details 3 & 7/SG1-6001 (IFC Drawings for Main Package dated 3/31/14)
Sign Message Schedule (ASI 127 dated 9/12/14)

Details 3 & 7/SG1-6001 call out for a Clipper Tagging Device on one side of the Sign Type PS6 Interior Directional Pylon with Clipper Tagging.

Per the Sign Message Schedule, some PS6 Pylons have 0 ea. (ex. PS6-G-03-020), 1 ea. (ex. PS6-G-05-022), or 2 ea. (ex. PS6-G-05-015).

Please confirm the number of Clipper Tagging Devices to be furnished and installed with PS6 Pylons.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The sides (elevations) and quantities of Clipper Tagging Devices to be installed at each Sign Type PS2 pylon varies based on that PS2¿s specific location (e.g., a PS2 that is backed up against the wall and away from traffic flow may not receive any Clipper Tagging Device, while a PS2 located in the middle of Grand Hall may receive multiple devices). The side (elevation) of a particular PS2 that will need to accommodate this device or devices is indicated on the Sign Message Schedule.

Note: As stated in the previous response to P1-0557, the ¿Clipper Tagging¿ device and is part of the vendor-supplied system to be bought-out separately by TJPA. The Sign Subcontractor would be responsible only for its installation and integration within the pylons and wall surfaces in which the devices are designated to be installed.

Detail 1/SG1-6003 (IFC Drawings for Main Package dated 3/31/14)
Specification Section 10 14 26 (ASI 127 dated 9/12/14)

Per Detail 1/SG1-6003, a 22" LCD is required on both sides of Sign Type PD1 Bus Deck Dock ID.

Specification Section 10 14 26 2.1 C Pylon Signage does not specify a 22" LCD for Sign Type PD1.

Please specify a 22" LCD for Sign Type PD1.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

· Specification Section 10 14 26 2.1 C 1 p q, Pylon Signage, added specification language for 22¿ LCD for Sign Type PD1:

p. Display: 22¿ diagonal flat panel display, commercial-grade LCD panel and components, full HD resolution, capable of displaying digital video signals, controllable via the IP network or RS-232.

q. Manufacturer List:

1) NEC

2) Samsung

3) Toshiba Display Systems (Integrated Display Technology)

4) Or approved equal

· As part of this RFI, in Specification Section 10 14

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

26 1.2 A 3 a, Pylon Signage, we have deleted the sentence Temperature Change (Range): 120 deg F (67 deg C), ambient: 180 deg F (100 deg C), material surfaces.¿ and replaced it with the sentence, ¿Temperature Change (Range): 120 deg F (48.8 deg C), ambient: 180 deg F (82.2 deg C), material surfaces.¿

· As part of this RFI, throughout Specification Section 10 14 26, Pylon Signage, we have deleted the words ¿Construction Intent¿ and replaced with the word ¿Signage¿.

See attached.

P1-0609 **Verbiage and Layout for Sign Type PS6 Interior Directional Pylon with Clipper Tag** **Closed** **10/21/2014** **10/31/2014** **11/06/2014** **Potentially** ☐

Detail 3/SG1-6010 (IFC Drawings for Main Package dated 3/31/14)
Detail 2/SG1-6011 (IFC Drawings for Main Package dated 3/31/14)
Specification Section 10 14 63 (ASI 127 dated 9/12/14)

Per Key Note 1 on Detail 3/SG1-6010, the commercial grade LCD for Sign Types SM1 WAll-Mounted Schedule Board and SS1 Digital Display are to be selected based on performance requirements.

Per Key Note 1 on Detail 2/SG1-6011, the commercial grade LCD for Sign Type SX1 Grand Hall Schedule Board is also to be selected based on performance requirements.

Per Specification Section 10 14 63 2.2 B Electronic Panel Signage, there is a specific list of named LCD¿s specified for these sign types.

Please confirm the LCD¿s for Sign Types SM1, SS1, and SX1 are to be selected based upon Specification Section 10 14 63, and not performance requirements.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

References to Digital Displays and their selection selected ¿based on performance requirements¿ has been eliminated from Key Notes. See attached SKSG #¿s 2018 through 2023 inclusive.

Note: Drawing SG1-6003 has not been included as part of the response to this RFI, as the same issue was addressed previously in another RFI.

3/31/14)

Per Detail 1/SG1-6020 braille raster beads are to be installed on the perforated aluminum access panel for Sign Type KC1 Combined Touchscreen & Digital Display.

Please provide the message and exact dimensions for locating the braille raster beads.

Braille raster beads, and attached SKSG #2026 for dimensional information regarding location of those Braille messages. The specific text for the Braille messages are not yet finalized but will be provided by TJPA when determined. Pricing can be based on the drawings, General Sheet Notes, Key Notes (as revised and noted on the attached SKSG¿s), as well as on the associated specifications.

P1-0615 **Footing Requirements per Specification Section 10 18 00 Informational Kiosks** **Closed** **10/21/2014** **10/31/2014** **11/18/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Specification Section 10 18 00 (ASI 127 dated 9/12/14)

Per Specification Section 10 18 00 1.2 Informational Kiosks, the signage subcontractor is to provide informational kiosks capable of withstanding the effects of wind loads based on criteria defined on the structural drawings, seismic performance criteria defined in Specification Section 01 80 50 Seismic Design Criteria for Nonstructural Components, and thermal movements defined in Specification Section 10 18 00 Informational Kiosks. There is no requirement to design the substrate upon which the informational kiosks are located.

In several locations (Signs KT2-G-05-56 through KT2-G-05-61 and KM1-G-05-055 in the Grand Hall for example), informational kiosks sit on top of the topping slab with no footing down to structure.

Please confirm that as long as the design requirements called out in Specification Section 10 18 00 1.2 are achieved, it is acceptable for the informational kiosks to be attached only to the topping slab with no footing through to structure.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Informational Kiosks referenced in this RFI, along with signage pylons or information kiosks (non-structural components) at Ground Floor, Second Floor, and/or Bus Level (PSI, PS2, PS5, PS6, PD1, PD2, KC1, KT1, KP1, KP3, KT2, KM1) are to be anchored directly to the structural slab or a housekeeping pad integrated into the structural slab as referenced in the Structural Drawings, Detail 1/S1-9102. Note that Section 1.2A of Specifications Section 10 18 00, Informational Kiosks, refers to Specifications Section 01 80 50 (Seismic design criteria for nonstructural components) for seismic provisions. Section 1.2B of that specifications section requires that the Contractor's design engineer designs and details the anchorage of these non-structural components. In the case of these aforementioned sign types, this design and detailing would be coordinated with the Signage Subcontractor's design and detailing of the signs' base components.

Updated details and locations of the housekeeping pads will be provided with ASI 0128.

Specification Section 10 14 66
Specification Section 09 51 23

Specification Section 10 14 66 2.2 C 3 d Floating Signage, indicates that Sign Type BS4 6-Icon Overhead Directional is to be ceiling mounted.

Specification Section 10 14 66 2.2 C 2 d Floating Signage, indicates that Sign Type BS3 4-Icon Overhead Directional is to be ceiling mounted.

Specification Section 09 51 22 Aluminum Ceilings does not address the mounting of Sign Types BS3 or BS4.

Please confirm Sign Types BS3 and BS4 signs are to be directly supported from the structural deck, or coordinate Specification Section 10 14 66 with Specification Section 09 51 22.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

· Specification Section 10 14 66 2.2 C 2 d Floating Signage, Sign Type BS3 has been eliminated as per previous RFI.

· Specification Section 10 14 66 2.2 C 3 d Floating Signage, the word ¿Ceiling¿ has been deleted and replaced with the words, ¿Structural deck above suspended ceiling¿

P1-0630 **Verbiage for Sign Type BG1 Applied Message Band on Glass** **Closed** **10/23/2014** **11/02/2014** **10/31/2014** **Potentially** ☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE:
Sign Message Schedule (ASI 127 dated 9/12/14)

Sign BG1-G-10-010 on the Sign Message Schedule indicates that Message A will be determined by the owner.

Please provide the verbiage for Sign Type BG1 Applied Message Band on Glass, or provide a basis of bid.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The verbiage for Sign Type BG1, Applied Message Band on Glass, has not yet been finalizedby TJPA. Pricing can be based on the assumption that the final graphic static map will be a double-sided, large format digital print to be sized, fabricated and installed as per the current drawings and specifications.

Co-Author:

REQUEST:

REFERENCE:
Specification Section 09 91 00 (ASI 127 dated 9/12/14)

Specification Section 09 91 00 1.7 C 1 Paint, indicates that painters are to refer to Specification Section 09 24 00 Portland Cement Plastering for painting of the cement plaster mockup.

Specification Section 09 24 00 Portland Cement Plastering does not call out for the cement plaster mockup to be painted, and RFI P1-0428 indicates that the cement plaster is not to be painted.

Please remove reference to painting the cement plaster mockup in 09 91 00.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The Portland Cement Plaster work is not painted. Please refer to markup of Specification Section 09 91 00 with the edited paragraphs deleting Plaster paint work.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0641	Incorrect Specification Reference for Painting Gypsum Board Mockup	Closed	10/23/2014	11/02/2014	11/06/2014	Potentially	☐

From: Webcor Construction LP Tram Nguyen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

REFERENCE: (ASI 127 dated 9/12/14)
Specification Section 09 91 00
Specification Section 09 21 16

Specification Section 09 91 00 1.7 C Paint states, "Refer to Section 09 24 00 for painting cement plaster mockup and Section 09 29 00 for painting gypsum board mockup." The correct Specification Section for Gypsum Board is 09 21 16.

Please revise the specification to correctly reference Specification Section 09 21 16 Gypsum Board.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification Section 09 91 00 1.7 C.1 is revised to delete ¿¿Section 09 24 00 for painting cement plaster mockup...¿ There is no paint system in the cement plaster work.

Specification Section 09 91 00 1.7 C.1 is revised to state the correct Gypsum Board Section 09 21 16.

P1-0657	Short Listed Planting Soil Materials Testing Labs	Closed	11/03/2014	11/13/2014	11/18/2014	Potentially	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference 32 91 00, 1.6.B.3 (IFC Main Set)

At the moment there are only three short listed Planting Soil Materials Testing Laboratories in the specifications. Are these the only three qualified laboratories in the country? If not, allow for an "or equal" Planting Soil Materials Testing Laboratory.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Add "or approved equal." Clarification to specification 32 91 00 will be reflected in 12/16/14 ASI-0128.

P1-0671	**Detail at the Amphitheater/Great Lawn Stairs**	**Closed**	**11/04/2014**	**11/14/2014**	**11/24/2014**	**Potentially**	☐

From: Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference L1-2630, L1-8633, L1-8687, L1-9621, L1-9622, 04 43 00, 01 10 30/APE (IFC Main Set)

Clarify if the amphitheater/great lawn stairs, between gridlines 3 and 4 are stone slab stairs as described in specification 04 43 00, or are wood deck as shown on L1-9621 and L1-9622. L1-2630 points to details that show stone (1/L1-8633, 1/L1-8687) and wood (L1-9622). The Note in details 2/L1-9621, 3/9621 and 1/L1-9622 refer to Alternate 33 which is for modification of stone paving. Sheet L1-9621 is referenced under Alternate 33 in specification 01 10 30/APE, but L1-9622 is not. Sheet L1-9621 and L1-9622 are labeled as wood deck and details refer to boards, not slabs and are using concrete masonry anchors. These details conflict with L1-8633 which shows the stairs as stone slab using stone stair anchor pins. L1-8687 also conflicts with L1-9621 and L1-9622. Overall there appear to be conflicting details for the amphitheater/great lawn stairs. Clarify which set of details are meant to be followed and delete any extraneous details. Correct 01 10 30/APE E.1.21 Alternate No. 33 reference drawings and specification sections.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Revisions to drawing and spec will be reflected in forthcoming 12/16/2014 ASI-0128.

Co-Author:

REQUEST:

REFERENCE: (ASI 127 dated 9/12/14)
Specification Section 09 66 23
Specification Section 09 66 22

Per Specification Section 09 66 23 3.1 C Epoxy Terrazzo Flooring, requires surface prep of the slab under epoxy terrazzo flooring (which includes removing sealers and coatings).

Per Specification Section 09 66 22 a terrazzo epoxy crack suppression system (which includes WPM-13) is to be installed below all terrazzo specified in Specification Section 09 66 23.

Please confirm that preparation of the concrete slab is to be as required in Specification Section 09 66 22, not Specification Section 09 66 23, and that the requirements in Specification Section 09 66 23 3.1 C will be removed from the documents.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Yes. Reference to the preparation of the concrete slab and installation of the terrazzo crack suppression system shall be deleted from section 09 66 23. See the attached updated specification.

RFI B-0047	BRP - Backfill Over Barrette Pile Concrete	Closed	09/05/2014	09/15/2014	09/11/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Arup Kevin Clinch

Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent

REQUEST:
Part 3.4.D.9 of Section 31 63 32 - Barrette Piles - Bus Ramps states the following:

Place concrete in a continuous operation until barrette pile is completely concreted to at least two feet above final top-of-pile elevation. Above this, place controlled low strength material (CLSM) or lean mix concrete to within 3 feet of the guide wall top. The top two feet of concrete and the CLSM shall be

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐
This is acceptable.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

demolished during exaction for the pile cap.

SCCI believes that using drain rock or sand, instead of CLSM, to backfill above the structural concrete will ensure that the rebar cage is clean upon the backfills removal. Using this lighter material will also work to ensure that bearing pressure limits are not exceeded while the second barrette pile is installed.

Is it acceptable to use drain rock or sand instead of CLSM for this backfill?

RFI T-0491 **BSE - Extract Timber Piles at Footing Along Gridline 33.5** **Closed** **04/09/2013** **04/19/2013** **04/17/2013** **Potentially** ☐

From: Webcor Construction LP Robert Kjome **To:** Turner Construction Company Gary Krutsch **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author: Balfour Beatty Infrastructure, Inc. Danny Walsh

REQUEST:

Reference Specification: 02 41 19
Reference Drawings: GT-2103 & D-2213

Based on conversation at the 4/3/13 weekly coordination meeting, BBII understands that the TJPA may consider lifting the ban on pile extraction previously issued in COM1347 (TCC letter dated 10-10-12) which directed all remaining piles to be removed by excavation and cutting.

BBII requests an exemption to the direction issued in COM 1347 that will permit the timber piles beneath the existing footing on gridline 33.5 to be extracted per the contract documents. The piles beneath this footing should be considered for exemption since they fall outside of the Zone 4 J-line "critical areas", the thin strip orientation has a minimal area of influence on the J-Line wall, and the geotechnical drawings already allow non-ground deformation control pile removal along most of the footing (see sheet GT-2103 & D-2213 attached).

Please advise if this request is acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is not acceptable.

Co-Author: Skanska USA Civil West California Dis Ryan Clayton

REQUEST:

On level 2 at the canopy areas and detail 1/S1-5032 refer to sketches CD RFI 171 SK1, SK2 & SK3 for items 1 to 4:

1) Confirm the erection aid angles bolted to the W sections are acceptable.
2) Confirm the required dimension of the angle to extend past the HSS.
3) Confirm the deck support angle indicated is acceptable and provide the required weld information.
4) Confirm the dimension for the bottom of deck to top of slab.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1) Acceptable.

2) Pop-Out perimeter angle is 4x4x1/4 on three sides. Plan Section A-A does not show perimeter angle per RFI T-0803.1 and 4/A1-8188. Please see page 5 of RFI PDF markup with location and dimension.

3) Acceptable. Provide a 3" long weld of ¼" fillet weld every 12" on both sides of the angle, similar to that shown in 10/S1-5002.

4) Dimension is 1 1/4" - see page 5 of RFI PDF markup with dimension.

RFI T-1096	**BGP - Area 4 Exterior Wall Verts in Contact With Waterproofing**	**Closed**	**01/09/2014**	**01/19/2014**	**01/14/2014**	**Potentially**	☐

From: Webcor Construction LP Michael Spillane **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author: Shimmick Construction Company, Inc. Sylvia Hartanto

REQUEST:

In Area 4, between soldier piles #41 and #42, there are approximately 13ea wall vertical bars that are in contact with the waterproofing due to CDSM Encroachment. Soldier Piles #41 and #42 were surveyed and shown to not encroach more than 1/2". However, at the elevation of wall lift 1, it appears that the CDSM encroaches vertically into the foundation wall. Due to the wall verticals having little or no clearance to the waterproofing, the first list wall vertical bars cannot be coupled onto the dowels protruding from the top of the haunch. Per discussion with TT field representative, Gerdau proposes the following:

Option 1: Remove the waterproofing, chip the CDSM wall between soldier piles 41 and 42 to allow for clearance between the vertical bars and waterproofing. Vertical bars adjacent to soldier piles
41 and 42, up to 6 total, will be abandoned.

Option 2: The dowels above the haunch will be slightly bent away from the CDSM wall to allow for threading of the first lift wall vertical bars. Prior to bending the bar, the haunch concrete will
have to chipped out a minimum of 1.5 ft wide by 1ft deep to allow for hickey bar access. Once the first lift vertical bar is threaded onto the dowel, then the vertical bar will be transitioned back
into vertical alignment with a slight bend over approximately 6ft. Note that this transition will require the wall horizontals to be bent and cross-ties will need to be shortened to follow the
profile of the wall verticals.

Please confirm if proposed options are acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Option 2 is preferred with the following modifications and additions:
1.Depth of haunch concrete removal shall be 1'-3" minimum at the encroaching bars.
2.Bars shall be bent such that the top of coupler is displaced 1" from the waterproofing.
3.Displacement shall be made in a controlled fashion.
4.Bars shall only be bent in one direction.
5.Embedded horizontal wall reinforcing that might prevent the field bend from occurring at the bottom of the 1'-3" excavation shall be locally removed. Other reinforcing shall be protected in place.
6.As proof of concept, work shall begin with the bars immediately in front of steel soldier piles. If displacement cannot be controlled for all bars at the soldier pile locations, Option 2 shall cease and Option 1 shall commence. No bars will be accepted that have displaced more than 2" without nondestructive testing; 1", however, is the target. Option 1 may continue to bars between steel soldier piles only after acceptance of work by the structural engineer.
7.The integrity of the waterproofing behind the excavation shall be maintained. Acceptance of the waterproofing by the manufacturer's representative and waterproofing contractor at the completion of field bending is required prior to patching the haunch excavation.
Option 1 is acceptable only if Option 2 does not produce acceptable results. Modification and additions to Option 1 are as follows:
1.The target cover for wall reinforcing bars is 2" minimum.
2.The minimum acceptable concrete cover over a bar or coupler at the level of the haunch is 3/4". This may require that CDSM grout be removed at the level of the haunch. To facilitate a smooth grout transition, this may require that grout be removed below the level of the haunch and perhaps excavation of the haunch itself. This has implications for waterproofing.
3.At locations where 3/4" cover is not provided to the coupler at steel soldier pile locations, the coupler shall be removed with due regard to protecting the adjacent installed waterproofing.
4.Any bars abandoned shall be replaced with bars having proper clear cover. It is not required that these

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

bars be doweled or spliced with the abandoned stubs.
5.The integrity of the waterproofing shall be maintained. Acceptance of the waterproofing by the manufacturer's representative at the completion of CDSM grout removal and patching is required.
This RFI may serve as the basis of a Corrective Action Plan which shall include:
Limits, products, and method of excavating and patching haunch concrete
If Option 1 is triggered, the CAP shall include:
Selective demolition plan and procedure for removal of the existing waterproofing and for the replacement of the back-up layers of materials and waterproofing.
Products and methods of CDSM grout removal and patching
Option 1 will not proceed until review and approval of the CAP Submittal by the design team and the owners waterproofing consultant.
Additional Requirements:
If waterproofing is damaged or otherwise deemed unacceptable, a supplement to the CAP shall be issued containing the repair.
Regardless of the option used to address the rebar issue, the contractor shall perform a vertical survey to establish the location of the CDSM wall and will establish its verticality. Sign off on the associated Nonconformance, NCR#441, will not occur before the contractor has presented documentation quantifying the presence or absence of a CDSM wall encroachment. Acceptable documentation would contain a vertical array of points capable of capturing bulges in the CDSM wall.
The owner's waterproofing consultant, the waterproofing contractor, the contractor's waterproofing designer, and the waterproofing manufacturer shall review the completed repair work to verify that the waterproofing has been properly protected or replaced (depending upon the repair procedure) prior to the continued installation of rebar.
Option 2 excavation and bar realignment may proceed per this RFI response

RFI T-1124	**SSS - Plate Grade Substitution**	**Closed**	**01/21/2014**	**01/31/2014**	**01/27/2014**	**Potentially**	☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

From: Skanska USA Civil West California Dis Ryan Clayton **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Note SS-1 on drawing S-0007 states plate used for built-up shapes as follows: "ASTM A572, Grade 50, UON (58 ksi max yield for plates used for beam flanges) ASTM 709, Grade 70W where specifically specified."

ASTM standards state the maximum plate thickness available in ASTM Grade 50 is 4", and for Grade 42 is 6" Numerous locations on the Moment Frame Columns specify thickened web plates that exceed 4" in thickness.

Is it acceptable to use ASTM A572 Grade 42 for plate thicknesses over 4"? If not, please specify required material and grade.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The topic of this RFI is related to the thicken web at the moment connection panel zone. As specified, all steel plates for built-up shapes shall be ASTM A572 Grade 50, or A709 Grade 70 where specifically specified. It is our understanding from steel fabricators, grade 50 plates thicker than 4" are available by normalizing grade 42 plates (a small premium) to gain higher strength.

RFI T-1151 **SSS - AESS Mockup Sequence Clarification** **Closed** **02/05/2014** **02/15/2014** **02/10/2014** **Potentially** ☐

From: Webcor Construction LP Stephanie Azzolino **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author: Skanska USA Civil West California Dis Ryan Clayton

REQUEST:

Please clarify the sequence the contractor is being asked to provide for the AESS mockup. Is the contractor required to provide a mockup (and have A/E review/approve) in the field at grid line 11 (South) per A1-8660 prior to fabricating all AESS elements as indicated in 05 12 14?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Specification section 05 12 14/1.6H states: "Mockups: Prior to fabricating AESS, construct mockups to demonstrate aesthetic effects as well as qualities of materials and execution." The purpose of the mock-up is to establish a standard of quality that will be provided in the other work. Fabrication of work prior to mockups approvals that may not meet the established standard of quality, presents a risk to the contractor. Submit a proposal to the TJPA Representative for when and how the contractor proposes to submit the mock-up and meet these goals within the Project Schedule.

From: Shimmick Construction Company, Inc. Chris Williams **To:** Webcor Construction LP Robert Kjome **Answered By:** Webcor Construction LP Robert Kjome

Co-Author:

REQUEST:

Reference Specification: 07 12 10

A two-ply self-adhered modified bitumen waterproofing system has been specified for this blind side application (Section 1.1 of Specifications). It is unusual for any modified bitumen system to be used in a blind side application (i.e., where the waterproofing is installed before the structure is constructed). Section 2.2 of the Specifications lists only one potential manufacturer, Laurenco Waterproofing Systems. The Laurenco system is a bitumen modified with chloroprene rubber and applied with a cold adhesive. The required waterproofing membrane properties listed in Section 2.4.B are identical to those published by Laurenco. We cannot find any other other modified bitumen manufactured with chloroprene on the market. Are you aware of any other systems?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

If Shimmick cannot find an equal system, proceed per the specified manufacturer.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author:

REQUEST:

Reference Specification: 07 12 10, 3.2-3.3

1. Section 3.2, D. requires the protection board horizontal construction joints to be shingled lapping the upper sheet over the lower sheet by 4 inches. What is the purpose of this shingle? Since the waterproofing membrane will not be adhered directly to the protection board and layers will be present between them (e.g. drainage composite w/filter fabric, insulation, felt), the shingle does not seem necessary. Please confirm.

2.Section 3.2, F. reads "seal top edge of filter fabric to membrane". There is a layer of 1/2" thick insulation between drainage composite and waterproofing membrane. Please clarify.

3. In addition to these items, there is also a concern about the number of layers used on this wall including the stability and durability prior to concrete placement. There is a large potential for problems such as creep of the

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Adhere to the manufacturers' specified details.

2. Please provide the manufacturer's shop drawings depicting the 1/2" thick insulation between drainage composite and waterproofing membrane.

3. We concur that asphalt saturated felt layers, drainage composite, filter fabric, and EPS insulation are required by the specifications as layers in the waterproofing. Please submit specific RFI's requesting clarification for dispcrepencies between the specifications and what is shown in the drawings. Furthermore, please address specific locations shown on the contract drawings that are in concern with the manufacturer's details.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

adhesives securing the various layers together and loss of adhesion between layers. What is
the purpose of the asphalt saturated felt layers, drainage composite, filter fabric and EPS insulation? Can some of these layers be eliminated? What level of adhesion is required between layers? Does this system of layers have sufficient rigidity to provide intimate contact between the waterproofing layer and

From: Shimmick Construction Company, Inc. Chris Williams **To:** Webcor Construction LP Robert Kjome **Answered By:** Webcor Construction LP Joanne Filipas

Co-Author:

REQUEST:

Specification Section 07 12 10, 3.2

The concrete surface profile (CSP) required by the waterproofing manufacturer Laurenco, ranges between a CSP level of 2 and 4 as defined by the International Concrete Repair Institute (ICRI) of technical guide "Selecting and Specifying Concrete Surface Preparation for Sealers, Coatings, and Polymer Overlays." The ICRI defines the levels of CSP as 1 (nearly flat) to CSP Level 9 (very rough). The Laurenco waterproofing system requires "a good wood screed or broom finish...often referred to as a 'sidewalk' finish..Do not use a steel trowel finish." See attached excerpt of the manufacturer specification.

1. Please confirm the specified ICRI CSP requirements as it relates to surface finish are to supersede the varying ASTM F-value requirements setforth in specification section 030300-3.6, B1 or provide a revised specification section 033000 incorporating the ICRI requirement.

2. Please confirm a wood screed or broom finish is accpetable for the mud slab.

Co-Author:

REQUEST:

Reference Drawing: A1-8710

Per Detail 1 on plan sheet A1-8710, the pipe penetration sleeves are not to be anchored to any portion of the CDSM wall. The sole mounting connection for these pipe sleeves is the bitumen waterproofing membranes. The waterproofing membrane is not strong enough to use as anchorage for these sleeves even with temporary support. The likelihood of jeopardizing the membrane with the design in Detail 1 is high.

S3H proposes a constructable solution. Please find attached the details for a constructible design. This design eliminates the waterproofing anchorage support of the

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Reference Note 5 on Sheet M-0006 which states "The header pipes shall be installed up to the ceiling of the lower concourse level recessed in the face of the CDSM shoring wall. Prior to construction of the top of the foundation wall the pipes shall run to grade where they are capped with pressure gauges. During the forming of the final portion of the foundation wall, the headers are to be modified and installed in their final position through the foundation wall. In their final position the headers will be valved and capped with a pressure gauge."

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

penetration sleeve. Please advise.

SHIMM000-0009 **BGP - Geothermal Loop Soil Compaction** **Closed** **03/04/2013** **03/14/2013** **03/04/2013** **Potentially** ☐

From: Shimmick Construction Company, Inc. Chris Williams **To:** Webcor Construction LP Robert Kjome **Answered By:** Webcor Construction LP Robert Kjome

Co-Author:

REQUEST:

After observing existing subgrade compactions varying from 88%-95%, it appears that the existing conditions of the soil could be below the 95% compaction requirement. In the case of a geothermal loop being installed in areas with existing soils below 95%, can the geothermal loop be compacted to the localized compaction level in accordance with ASTM Dl557? For example, if the first field has an existing condition of88% compaction, can the geothermal loop trenches be compacted to 88%? 95% compaction may not be possible with the existing soils and existing compaction in some areas.

Please advise.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

See Response to RFI T-0387 and RFI T-0405.

SHIMM000-0010 **BGP - Schedule Dates for GLS/GLR Manifold Construction** **Closed** **03/05/2013** **03/15/2013** **03/05/2013** **Potentially** ☐

SHIMM000-0020	BGP - Waterproofing and CJ Layout Conflict	Closed	04/10/2013	04/20/2013	04/10/2013	Potentially	☐

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Kirk Nielsen **Answered By:** Webcor Construction LP Kirk Nielsen

Co-Author:

REQUEST:

Please reference Al-2203 and Sl-3201ofthe Contract Plans and the attached drawings. The current elevation at the bottom ofthe 2nd level bracing lookouts is at approximately -5.13, WEST of Grid 9 (see concourse slab drawing). The proposed top of concourse slab elevation is to be -5.42, WEST of Grid 9. Per the WPM-1 waterproofing system, the minimum overall tie-in dimension needed for the succeeding lift is approximately 1 '-11" (see attached waterproofing drawing). The current elevation at the bottom of the 2nd level bracing lookouts is at approximately -6.15, EAST of Grid 9 (see concourse slab drawing). The proposed top of concourse slab elevation CJ is to be -7.67, EAST of Grid 9. Per the WPM-1 waterproofing system, the minimum overall tie-in dimension needed for the succeeding lift is approximately 1'-11" (see attached waterproofing drawing). In both locations, the minimum required dimension (1 '-11") to tie-in to the next lift of waterproofing can not be reached with the current location of the 2nd level bracing lookouts and the proposed concourse slab elevations. SCCI is restricted in location for the CJ due to the absolute concourse slab location and elevation.

Furthermore, a similar conflict exists in the 1st foundation wall lift and the 3rd level of bracing lookouts (see 1st wall lift drawing). With SCCI's current location of the CJ, there is virtually no room to allow for the waterproofing overlap to occur. SCCI fully understands its freedom to manipulate the location of the CJ's by lowering it approximately 2'. This will potentially change BBII's rebracing plans.

Please advise.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Consistent with RFI response #SHIMM000-0002 dated 11/27/12, revise the proposed locations of the CJ's to accommodate / coordinate with all of SCCI's work consistent with the sheet note on 1/S1-3201.

SHIMM000-0023	BGP - Carlisle Miradrain 9900 Drainage Composite	Closed	04/26/2013	05/06/2013	04/26/2013	Potentially	☐

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Robert Kjome **Answered By:** Webcor Construction LP Robert Kjome

Co-Author:

REQUEST:

Reference Specification: 07 12 10 2.5.C

This section calls for "Drainage Composite: Three dimensional plastic rolls bonded to a geotextile on one or both faces: Mirafi Miradrain 9900, or equal with a minimum compressive strength of30,000 psi." The waterproofing membrane manufacturer (Laurenco) states that the specified product "Miradrain 9900" no longer meets the performance requirements of the specifications since the woven filter fabric is no longer bonded at every dimple of the molded polystyrene core. Best Contracting has contacted the drainage composite manufacturer and they have confirmed that the woven filter fabric is bonded at every fourth dimple. Best Contracting has also performed a shop "mock up" using the aforementioned composite which resulted in complete separation and failure upon the installation of the waterproofing membrane. Please provide direction.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Fully bonded Miradrain 9900 is available upon request of Carlisle. If Bestdoes not want to use Miradrain submit a request for substitution pursuant to specification section 011630 and 000440.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
SHIMM000-0024	BGP - Additional Fasteners for Protection Board Installation	Closed	05/02/2013	05/12/2013	05/02/2013	Potentially	☐

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Kirk Nielsen **Answered By:** Webcor Construction LP Kirk Nielsen

Co-Author:

REQUEST:

Please reference Spec Section 07 12 10 - 3.2.D. Spec Section 07 12 10 - 3.2.D states the following: "Secure 1/4" protection board to flanges of soldier piles with powder driven fasteners and washers spaced 12 inches o.c. Butt vertical joints . Maximum joint width : 1/4"..."

The manufacturer of membrane waterproofing system (Laurenco) has indicated that due to "out of plane" piles, and relaxation of CDSM substrate requirement, they are requiring intermediate fasteners to hold the 1/4" protection board tight to the CDSM wall. Please review and advise.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The pile plane always had a tolerance as was the CDSM surface was never continuously supported.

Consistent with John Laurence (Laurenco's) comments during the 4/30/13 waterproofing meeting the concern over the protection board deflecting can be mitigated by two methods:

1. Intermediate fasteners
2. Ensuring when placing concrete SCCI does not cause the protection board to excessively deflect.

This is a means and methods issue at the discretion and cost of the Trade Subcontractor.

Co-Author:

REQUEST:

Please reference attached Contract Drawings PI-2202 IFB and PI-2202 IFC. Both IFB and IFC plumbing drawings have the callouts "BELOW GRADE PACKAGE FOR REFERENCE ONLY", "NOT FOR CONSTRUCTION" and do not contain the Architect's/Engineer's seal. This circumstance applies to all Lower Concourse Level and Mezzanine level Plumbing Contract Drawings, PI -2202 to PI-2211 and PI-2252. All Lower Concourse and Mezzanine plumbing depicted in these drawings is excluded from the Below Grade Package. The scope excluded from SCCI's work package includes, but is not limited to, floor drains, area drains, floor sinks and cleanouts. Please inform SCCI about which future package this scope is contained for coordination.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

TG06 scope of work for the lower concourse and mezzanine includes all sleeves and openings as per the contract drawings and specifications. The future package containing the floor drains, area drains, floor sinks, and cleanouts has not gone out to bid.

SHIMM000-0031 **BGP - S-3 Wall Stirrups Preassembled Using IDEA Machine** **Closed** **06/04/2013** **06/14/2013** **06/04/2013** **Potentially** ☐

Co-Author:

REQUEST:

SCCI is in receipt of CR #071- ASI #104 on Jun 26th, 2013. This ASI #104 changes the layout of the room in area 3 mat slab. This changes the partition wall configuration and the dowels coming out of the mat slab that are required for the construction of the partition wall rebar.

SCCI is also in recipt of RFI response to T-0612 on July 2nd, 2013, after the issuance of ASI #104. In this RFI response, the layout of the rooms and partition walls, as well as updated wall, door opening, and control joint locations for the B2 Emergency Electrical Room B2880 shown in A1-9214 are altered with the issuance of SKA-2746 to 2750.

Please confirm which room layout, door opening, and control joint SCCI is to construct and install, especially the layout as shown on A1-9214. (E.G: Please provide the most final/ updated drawings)

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

SCCI is to construct and install per RFI T-0612 response, which is the most up-to-date drawing.

Co-Author:

REQUEST:

Please reference attached letter published by Jon Feld, CTL Group, dated July 8, 2013. This letter contains further analysis of the "Perfomance-Based Temperature Differential Limit", also refered to as "Strength-Based Temperature Difference Limit", for Mat Slab mix # 1557204.

This additional analysis was prepared per RFI response T-0585, in which the reviewer found this PBTDL method to be acceptable based on satisfying four (4) conditions. See below:

I. The attached analysis was specifically developed for mix #1557204

2. SCCI confirms that all remaining mass concrete specification requirements shall still apply.

3. Shimmick Construction will be providing field quality control and the required concrete maturity measurements through the "Concrete Maturity HardTrack System". Reference attached HardTrack system data and example concrete maturity data. This system has been procured by Shimmick Construction, and has been sucessfully tested on multiple mock-ups.

4. It is confirmed that Shimmick Construction shall remain responsible for providing a mat foundation that meets requirements of the contract documents.

Please confirm conditions have been satisfied. This analysis will be submitted as a supplement to the Mass Concrete Plan (TG0600-20 1.1)

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The conditional requirements set forth in RFI T-0585 by George Metzger appear to be satisfied. Procedural requirements are approved via submittal. Please revise and resubmit via submittal package TG0600-201.X (TG0600-201.2, item # 033020-011.1.)

Co-Author:

REQUEST:

Per discussions in the Trade subcontractor meeting with Turner, BBII, and WOJV, it is apparent that BBII has been directed to demo the buttress shafts in Zone 4 to bottom of

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

BBI's contract drawing GT-2103 and the Geothermal shop drawings (TG0600-065), indicate the excavation and demolition of the buttress is set to final subgrade

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

mud slab elevation. Per the geothermal trenching and backfill specification 31 23 34, 1.1.A.1, the only slot excavation in CDSM/concrete is to be in the wall panels. The specification does not require slot excavation/demolition for the horizontal field loops. Per Plan sheet GT-5201, the buttress shafts are to be demolished to a maximum of 4' below subgrade elevation (bottom of mud slab). The geothermal pipe is to be installed at 15" below the bottom of mud slab elevation, well within the 4 ' below mud slab demolition elevation. Please confirm that the geothermal loops in zone 4 will be trenched in soil like the rest of the project and as detail din the geothermal trenching and backfill specification (31 23 34).

elevation 41'-5" or bottom of the mud slab. SCCI¿s interpretation on plan sheet GT-5201 as it relates to demolition is incorrect. The note "...shafts shall be maximum 4 feet below, maximum 2 feet above subgrade elevation" is in reference to the parameters set for the concrete (high strength) being placed in relation to the CLSM mix. These parameters are not set as demolition or excavation bench marks.

SCCI to proceed with geothermal loops in Zone 4 as shown in the approved shop drawing TG0601-065 and conform to specification section 31 23 34. SCCI to remit request for backfill and excavation requirements per specification 31 23 34 at buttress locations.

SCCI to consider the following when re-submitting: Does SCCI plan to demo the buttress shafts down to the required 15",re-fill the area and meeting compaction requirements? or Does SCCI intend to seek a design variance by slot excavating through the buttress' and seek back-fill requirements within the buttress from the design team?

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

The latest Webcor's weekly update schedule received by SCCI (Data date 06.17.2013), shows that:

- Bracing Removal- Level D" (BGSOX-1120) is the driving predecessor to "Wall Waterproofing} st lift" (BGSOX-4000)- in each area.
- Bracing Removal- Level C" (BGSOX-4100) is the predecessor to "Wall Waterproofing- 2nd lift" (BGSOX-4110)- in each area
- Bracing Removal- Level B" (BGSOX-6000) is the predecessor to "Wall Waterproofing- 3rd lift" (BGSOX-6010) in each area

Based on the current schedule logic, the bracing will need to be modified to allow the removal of walers and struts in each area, separately and independently from each other. E.g: Any walers spanning two areas will need to be cut during removal of bracing so SCCI can proceed with the waterproofing install in that area, without having to wait for the adjacent area. This is applicable to Bracing Removal level B, C and D. As requested in RFI#233 response, please find attached bracings that SCCI assumes are going to be removed/ cut prior to SCCI's specific wall pour.

Please confirm.

SHIMM000-0242.1 **BGP - 100% CD Phase 1 Documenation** **Accepted** **08/22/2013** **09/01/2013** **Potentially** ☐

REQUEST:

Reference: Drawing P1-6001, Spec Section 22 13 01

See attached marked up Rev 0 and Rev 1 Drawings P 1-6001. Pl-6001 Rev 1 is a revision per AST 104. Rev 1 of the noted drawing does not have any "for reference only" notations in the details.

Is the intent of the Designers to significantly change the scope of TG06 work?

Please clarify the scope of work, i.e. applicable and non applicable details of the CD P1-6001 for the TG06 package.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

As per the attached drawing:

1. Detail 1, 2 and 5 of drawing sheet P1-6001 (ASI #104) depict typical standpipe details. These details are not applicable to the TG06 package.
2. Detail 4/P1-6001 (ASI #104) depicts a change in the floor clean-out cover. This detail is applicable to the TG06 package where the floor drains are either at the concourse and mat slab level and the specific detail is called-out for "floor cleanout detail."
3. Detail 6/P1-6001 is applicable if below the concourse slab. Typ.
4. Detail 11 and 12 of sheet P1-6001 show sump pump details titled "Detail At Mech Pump Room B2230 and B2442." The applicable scope to TG06 includes embeded pipe in the mat slab or added pony wall, pony wall and pit opening.

WOJV welcomes a page-turner with SCCI for any

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

future clarifications.

SHIMM000-0261 **ASI#104- TG06's Scope Clarification** **Closed** **07/26/2013** **08/05/2013** **07/26/2013** **Potentially** ☐

Co-Author:

REQUEST:

There are multiple changes beween the Issued for Construction (IFC) drawings to the newly issued ASI #104 drawings. This RFI requests for information regarding TG06's scope of work that may or may not be added through the issuance of ASI #104 due to removed notations "For Reference Only " or similar.
Please provide clarifications of TG06's Scope per ASI #104 in the following drawings (also attached):

S1-7005, S1-7101, S1-7111, S1-7600, S1-7602, S1-7660, S1-9000, S1-9050 and S1-9051.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Per the attached drawing:

1. Per drawing S1-7005 (ASI #104), exclude all steel/stair components, all other details are applicable. Show credits for wall removal etc. accordingly in pricing reviiew of ASI #014.
2. Per drawing S1-7101 (ASI #104), the only applicable detail is 1/S1-7101. All othe detail are shown to be on the ground level, second level and bus deck level. Please note, there will be no poured in place walls on the concourse level in the TG06 package; however, SCCI will provide the applicable dowels to accomodate the tie-in.
3. Per drawing S1-7111, the details in question are on the ground, second and bus deck level. Not applicable
4. Per drawing S1-7600, the details in questions are metal stair related. Not applicable.
5. Per drawing S1-7602, see item #4. Details are Slab On Metal Deck.
6. Per drawing S1-7660, all details in question are applicable to TGO6 trade package.
7. Per drawing S1-9000, the only applicable scope to TG06 package will be dowels for CMU tie-in
8. Per drawing S1-9050, see note 7.
9. Per drawing S1-9051, the detai lin question is applicable only if this detail occurs at the concourse slab and below.

SHIMM000-0263 **BGP - Revised Attached Method of Nelson Studs to the Elevator Pit Embedded An** **Closed** **07/24/2013** **08/03/2013** **08/05/2013** **Potentially** ☐

Co-Author:

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REQUEST:

Reference: Spec Section 05 50 10

While attaching the 3/4" diameter by 8" Nelson Studs to the 8" X 4" X 1/2" angle it was determined the studs were not fusing to the base metal (angle). To maintain the procurement schedule of this fabrication needed for the Zone 1 - Area 03 Mat Slab placement, our fabricator (Gerlinger Steel) used the fillet weld method performed under the attached Welding Procedure Specifications (WPS) to attach studs to the angle(s). The welding was witnessed by the dispatched (IR #001459) ISI Shop CWI. Attached for the readers informationm and use are the shop fabrication drawing, the employed WPS, and photographs of the finished fabrication.

Is the alternate means of attaching the Nelson Studs to the angle, using the fillet weld method in lieu of the fusing method, acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The angled stud in the interior of the angle requires a different type of ferrule (heel) to address the angled condition. The alternate means used to attach Nelson studs for angles in this RFI is acceptable provided that at least 2 studs per angle have been verified by bend test per specification section 03 20 00 2.2.C.2, which references AWS D1.1-2010 (Paragraph 7.8 for testing requirements).

SHIMM000-0264 **BGP - Shear Wall Dowel and Shoring Pipe Bracing Conflict** **Closed** **07/24/2013** **08/03/2013** **08/07/2013** **Potentially** ☐

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Jackson Tukuafu **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: Drawing S1-3001, Spec Section 03 30 20

A few potential conflicts exist between the typical shear wall vertical dowels and the 36" OD shoring Pipe Struts in Area 1. See attachement for locations of conflict.

Based on Detail A shown in S1-3260, the typical shear wall verts will be lap spliced.

Per the schedule in Detail 1-S1-3001, the #9 vertical shear wall reinforcement requires a 63" lap splice, which places the top of dowel at elevation -30'-5".

The centerline of Level D diagonal bracing atop Area 1 is shown to be at EL -29'-0" and the bottom of the 36" OD pipe strut at level D is at EL -30'-6".

The pipe strut will potenially encroach on the shear wall

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The contractor proposed lap splice length is acceptable only at locations where the conflict exists.

Number	*Subject*	*Status*	*Date Created*	*Date Required*	*Date Answered*	*Cost Impact*	*Proceed*

dowels since the vertical spacing is #9 at 10" OC.

Please confirm that a 60" lap splice is acceptable at locations where conflicts exist, if not please provide soultions.

REQUEST:

Please reference attached drawing E1-2205 and E1-4105.

Per the attached lighting plan drawings, there are no electrical conduits shown to be embedded exclusively for the Light Column on drawing S1-6005.

Please confirm that there are no conduits required for the light column in both the concourse slab and mat slab or provide the location, route and size of the conduit at each level.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

No, there are no embedded conduits required in lower concourse slab or mat slab.

SHIMM000-0266	BGP - Temporary Perimeter Lighting	Open	07/24/2013	08/03/2013	07/30/2013	Potentially	☐

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Jackson Tukuafu **Answered By:** Webcor Construction LP Jackson Tukuafu

Co-Author:

REQUEST:

Per the TG06.0 pre bid Q&A TG06.0-0036 response dated 6/11/12 (attached), the temporary perimeter lighting drawings are to be issued to the trade subcontractor prior to the start of the work. When is this work scheduled to begin? Are the drawings and specifications for the perimeter lighting available?

Please provide the required documents or clarify when they will be provided.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

SCCI to produce and provide all information including, but not limited to, product data and layout drawings necessary for installing and maintaining temporary lighting along the perimeter of the site at 50'-0" O.C. and installed in such a manner that it does not interfere with the structure and at all walkways utilized by the workers and the public, as required to provide code-minimum lighting at egress paths, as well as sufficient foot candle lighting levels to safely perform the work at all times.
SCCI is responsible for maintaining the temporary lighting and related facilities until completion of the work.

SHIMM000-0267	BGP - Mat Slab Conduits	Closed	07/24/2013	08/03/2013	08/13/2013	Potentially	☐

From: Shimmick Construction Company, Inc. Chris Williams **To:** Webcor Construction LP Jackson Tukuafu **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference: A1-9204, E1-6001

The electrical conduit details on sheet A1-9204/Detail 1 and Detail 5 on E1-6001 regarding the electrical conduits on the columns are in conflict. Detail 1 on A1 -9204 indicates an embedded junction box in the long portions of the columns at Line D.8 above the Train Platform Level. Detail 5 on E1- 6001 indicates all conduits are to be stubbed up 12" at the face of the column. This Detail 5 shows all conduits (shown dashed) above the 12" stub up in the Mat Slab are to be installed in future phases outside of the TG06.0 contract. The columns are part of the TG06.0 scope.

1. Please clarify if these junction boxes and conduit are to be embedded in the columns or stubbed up through the slab at the face of each column at all four (4) locations..

2. If the conduits and boxes are to be embedded in the columns please provide a revised embedded conduit detail indicating conduits as part of TG06 Below Grade Scope.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The embedded junction box details on A1-9204 applies only to the flat surfaces (north and south sides) of the columns along GL D.8 of Platform 2 (refer to note on details 1 & 2 on A1-9204) and shall have embedded boxes and conduits. Locate the conduit and boxes such that the device faceplates will be finished flush to the finished column cladding.

The east and west sides of the columns indicated on the note shall have surface mounted junction boxes and conduits (refer to detail 1 on A1-9204).

For all other columns in the BGP, the junction boxes and conduits are typically surface mounted (refer to detail 5 of E1-6001).

Co-Author:

REQUEST:

Reference: Attached Drawings

The highlighted areas on the attached re-shoring drawings show re-shoring struts against some of the oval shaped columns. In order to construct the concrete columns SCCI will need at least 30" of clearance between the column face and the struts.

Please confirm that the reshoring struts will be moved enough to provide needed clearance.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Further review and coordination of specific struts that are in conflict or in close proximity to formwork is required. Please submit as-built of all locations that are in concern.

SHIMM000-0269	BGP - 1st Street 48" Bridge Pile Asbuilts	Open	07/25/2013	08/04/2013	07/31/2013	Potentially	☐

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Jackson Tukuafu **Answered By:** Webcor Construction LP Jackson Tukuafu

Co-Author:

REQUEST:

Reference: Drawing S1-3003

48" temporary bridge piles (00 1 through 010 in the drawing attached) under the 1st Street temporary bridge exceed the 48" diameter required per Detail 6 on Plan Sheet S 1-3003. The varying diameter of each temporary bridge pile is the result of the pile being a 48" CIDH concrete pile instead of a steel pile like the rest of the slab penetrations. As typical of a CIDH pile, the surface profile varies much greater than the 1 /2" gap tolerance required per Detail 6 on S 1-3003. Attached is an as built of the 48" piles with their varying diameters. In consequence the penetration sleeves will not fit the current conditions of the 48" piles.

Please advise how to proceed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

BBI's temporary bridge detail drawing SH-5101, depicts the CIDH pile diameter at 48". Our review of the the Caltrans specification on CIDH piles indicate no reference to tolerances; therefore, we cannot ascertain any diameter larger than 48". SCCI to proceed as shown on the BBI and contract drawings with the CIDH pile at 48" in diameter. Please note, SCCI has ten (10) sleeves fabricated and onsite. The remaining sleeves are in fabrication at this time.

SHIMM000-0270	BGP - Clear Cover to Mat Reinforcing at CDSM Pile Encroachment	Closed	07/30/2013	08/09/2013	08/07/2013	Potentially	☐

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The proposed option is unacceptable. Without any protection on the sloped surfaces of the pits, iron

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Due to quality and constructability concerns of placing a 4" thick slab on the 45-degree plane of the pits, installed on waterproofing membrane, SCCI is proposing the option to pour the sloped plane of the pits with the mat slab. In order to provide protection from pit reinforcing steel, SCCl will place the protection slab in the bottom of the pit, 12" up the sloped plane on all sides, and the horizontal placement will stop at the top edge of the pit.

Per the Grace waterproofing requi rement that tbe membrane not be left exposed for more than 56 days al\er installation, SCCI will ensure that the membrane never exceeds the 56-day exposure limit.

Please confirm this option is acceptable?

workers may damage the waterproofing. Furthermore, once the rebar is installed it is very difficult to go inside these cages and perform an inspection on the waterproofing.

Other means and method options for SCCI to consider, include but not limited to:

1. Installing #3 rebars at 18" o.c. each way similar to what was done in the mud slab.
2. Use smaller aggregate 1/2" instead 1".
3. Install top and bottom protection slab first and then pour this sloped surface after.
4. Try to pour concrete similar fashion it was poured at the steep pit mud slab. You may need to add more dobe's horizontally to allow the concrete to adhere to 1 1/2" space between bars and waterproofing. Rebar is more stronger than wire mesh for someone to climb up onto the surface.

SHIMM000-0282 **Temporary Power from Skids #3 and #4** **Open** **08/14/2013** **08/24/2013** **08/14/2013** **Potentially** ☐

From: Shimmick Construction Company, Inc. Chris Williams

To: Webcor/Obayashi Joint Ventu Spencer Sayles

Answered By: Webcor Construction LP Jackson Tukuafu

Co-Author:

REQUEST:

SCCI and Bass had planned to used Temporary Power "skids #3 & #4 for temporary power needs. Currently Skids #3 & #4 are not available and have been removed and are unavailable. Will these skids be up and running in time fto use for temporary power? If not, where should SCCI and BAss route temporary power from? Serving the projects temporary power needs from Skids #1 and #2 is not feasible.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Please refer to Drawing SL-001 of Exhibit A.

Temporary power skids 3 & 4 are not represented in any of trade group package TG06 contract documents. As indicated in trade group package TG06 Exhibit A, SCCI is required to tie into the "nearest" power source; furthermore, the Site Logistics Plan drawing SL-001 show the location of three (3) skids (Skid 1, 2 and 5) to tie into. Servicing the projects temporary power needs is a means and methods by SCCI. Overcoming distance and circuitry limitations, include but not limited to, increasing the load capacity to each zone and/or using available Skid 5.

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Jackson Tukuafu **Answered By:** Webcor Construction LP Jackson Tukuafu

Co-Author:

REQUEST:

See attached Gerdau's RFI #066

Withing all of the Moment Frame Beam Sections found in the structural drawings, the T9 ties are depicted alternating. Gerdau is proposing to install the T9 ties within the Moment Frame Beams with all the 90 degree hoods at the bottom rather than alternating.

During the installation of the mock up, it was evident that the process of hooking the 135 degree hook around the bars at the bottom of the beam was problem due to the limited clearance (1.5") and the depth of the 135 hook (4.5"). By eliminating the alternating ends and only installing the 90 degree hook end down, it would resolve this situation.

Please confirm that this configuration is acceptable withing the Moment Frame Beams.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Per meeting between TT, WOJV and SCCI on 08/08/2013, TT rejected the non-alternating configuration per code.

From: Shimmick Construction Company, Inc. Filip Filipic **To:** Webcor Construction LP Jackson Tukuafu **Answered By:**

Co-Author:

REQUEST:

See attached page from DBI's standard catch basin detail, and reference drawings P1-6001 and P1-2022 thru 2030.

On 08/26/2013 during pressure testing inspection of the drainage lines in mat slab areas 1 and 2, DBI Plumbing Inspector has pointed out that all catch basins in the mat slab should be constructed per attached detail.

Contract drawings do not show catch basins details with cleanouts, vents and trap primer connections. Constructing the catch basins per attached sheets constitutes a compensable change.

Please provide details and direction for construction of the catch basins.

SHIMM000-0303	BGP - Chamfer Bar Top Hook	Closed	08/29/2013	09/08/2013	08/29/2013	Potentially	☐

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Jackson Tukuafu **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

See attached Gerdau's RFI#74.
See attached SKS-74

In an effor to prevent the chamfer bar from encroaching on the existing shoring waler beams, Gerdau would like to propose over bending the top hook and turning it into a standard 180 degree hook as shown on the attached sketch.

Please advise if this is acceptable

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Contractor-proposed 180 degree hook for the chamfer bars that are in conflict with double shoring walers is acceptable for bars that have not been fabricated. The radius point for the bend shall remain located as originally detailed on 1/S1-3201.

SHIMM000-0304	BGP - Drainage Conflicts with Reinforcement	Accepted	08/29/2013	09/08/2013		Potentially	☐

From: Shimmick Construction Company, Inc. Filip Filipic **To:** Webcor Construction LP Jackson Tukuafu **Answered By:**

Co-Author:

REQUEST:

See attached marked up contract drawings PSK-2022 and S1-3005

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Some of the drainage lines and fixtures are designed to be constructed in close proximity of the concrete columns, similarly S1-3005 depicts typicall mat shar reinforcement schedule and details. Some of these shear reinforcement bars will be interfering with the drainage lines and fixtures. SCCI suggest to displace these shear reinforcement bars where conflicts occur. Displacement would occur lateraly, in 8" increments, governed by the grid of the mat slab main reinforcement bars.

Please advise.

SHIMM000-0305 **BGP - Haunch Reinforcement at Double Waler Condition** **Closed** **08/29/2013** **09/08/2013** **09/02/2013** **Potentially** ☐

From: Shimmick Construction Company, Inc. John Berggren **To:** Webcor Construction LP Jackson Tukuafu **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Gerdau RFI No. 075 dated August 29th, 2013

This RFI is to confirm the resolution as proposed in the field. At the double shoring waler condition, where the waler web is lower that that of a single waler, the tail of the #10@8" (10C262 on BM-3t) haunch reinforcement interferes with the web of the shoring waler. The condition was observed at Grid 2/ A and will likely repeat at other double waler locations. The resolution to the condition shall be to adjust the position, where required, so that the interfering tail clears the double waler web. As a result the 1-1/2" clear cover will deviate up to 4-112" of clear cover. The plan loaction of the tail shall remain as close as possible per the placement drawings. See the attached sketch for further details. The 1-1/2" clear spacing shall remain at locations unaffected by the reduced clearance of the double-wlaer. For pieces not yet fabricated and delieverd, Gerdau has submitted in [Gerdau] RFI #074 {SCCI #303} a proposed solution to conform to the 1-1/2" clear cover.

Is this confirming RFI accurate and acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The revised haunch reinforcement clear cover as described in the RFI per field coordination is confirmed.

REQUEST:

Per field instructions, to help alleviate congestion in the mat reinforcing, and in particular, congestion resulting from add bars due to openings and penetrations, please confirm the following:

1. Details 4 and 7 on Sheet S1-3009 in so far as they apply to trestle piles, pin piles, dewatering wells and piezometric pipes can be relaxed in terms of additional bars. For an even number of bars interrupted (typical bars and add bars) the number of bars added on either side of the opening can be (number of interrupted bars)/2. For an

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

odd number of bars interrupted (typical bars and add bars) the number of bars added on either side of the opening can be (number of interrupted bars +1)/2.
2. Detail 1 on Sheet S1-3501, which applies to sinks, can be relaxed in terms of additional bars. For an even number of bars interrupted (typical bars and add bars) the number of bars added on either side of the opening can be (number of interrupted bars)/2. For an odd number of bars interrupted (typical bars and add bars) the number of bars added on either side of the opening can be (number of interrupted bars +1)/2. The minimum requirement of 2 bars on either side of the opening need not apply.
3. The number of bars and maintenance of clear spacing will take precedence over 8¿ or 4¿ module spacing as to minimize the number of potential bar interruptions (and minimize resulting add bars). Any bar may be displaced to avoid conflict. The maximum center-to-center spacing of any two adjacent bars may be as large as 16¿. Clear spacing of 1 bar diameter shall be maintained between bars where bar relocation necessarily reduces spacing in the vicinity of relocation. Where bar relocation affects a lap splice, noncontact lap splices will be allowed up to 6¿ for #10 and #11 bars. This remedy shall apply in particular when seeking to avoid interruptions at small penetrations such as risers, vents, sinks and conduits.
4. Clear spacing of 1db minimum shall be maintained in all mat reinforcing except for contact lap splices.5. Measures to reduce congestion at other locations such as catch basins, sump pits, elevator pits, shoring bracing and bridge piers will be considered on a case-by-case basis during field coordination with Thornton Tomasetti¿s field representative.

REQUEST:

The response to RFI 0782.1 stated that the walls in the attached CAD layout were not properly coordinated and included an AAI mark-up. Per 1/A1-9225 which was provided in the response to RFI T-0899, the walls between the mat slab and conccouse level are knee walls with a 4" lip. As shown and laid out, the knee wall lip will be 4 3/8" on three sides and 4 3/4" on the wall nearest to GL 19.9. This area will be included in the pour on 12/07/2013 and the form savers and conduits ha ve already been installed, therefore any layout changes will incur additional costs.

Please confirm layout as shown is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The layout provided appears to be satisfactory; however, the final layout should be coordinated with latest direction in RFI T-0899 and submitted via submittal shop drawing for review.

REQUEST:

The response to RFI 0781.1 stated that the walls in the attached CAD layout were not properly coordinated and included an AAI mark-up. The AAI mark-up shows the incorrect gridline location for Electrical Room B2640. In addition, due to the fact that the walls at this location are knee walls with a 4" lip per 1/A1-9225 that was provided to SCCI in RFI T-0899 response received on 11/15; the walls submitted in RFI T-0781.1 are indeed coordinated correctly per the sketch dimensions (AAI sketch is based on platform drawing, not mat slab drawing room which SCCI based the layout from). This area will be included in the pour on 11/23/13 and the form savers and conduits have already been installed; there any layout changes incur additional costs.

Please confirm layout as shown is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The latest layout and/or revisions to the aforementioned Electrical Room was provided in RFI T-0899 on 11/15/2013. Please submit the as-built layout as coordinated with RFI T-0899. Submit layout via submittal shop drawing package as directed in RFI T-0781.1 for review.

SHIMM000-0340	**Areas 5 and 6 EW Top Mat Reinforcing at South Wall Radius**	**Open**	**10/04/2013**	**10/14/2013**		**Potentially**	☐

From: Shimmick Construction Company, Inc. Filip Filipic **To:** Webcor Construction LP Spencer Sayles **Answered By:**

Co-Author:

REQUEST:

Refer to the attached sketch 131003_S105-S106 South Radius.

In Areas S105 and S106, EW top mat reinforcing makes an increasingly acute angle with the south wall. This eventually prevents the reinforcing from penetrating the haunch and wall reinforcing curtains to reach the edge of the mat.

Per field coordination, it is acceptable to terminate EW top mat reinforcing in a hook prior to reaching the edge of the mat slab. The provisions are as follows:

¿ All terminating EW top mat reinforcing shall be hooked
¿ Where the angle becomes such that the mat reinforcing cannot penetrate the inner wall reinforcing. The reinforcing may terminate immediately in front of the wall reinforcing inside the haunch. This is labeled Zone 1 in the sketch.
¿ In Zone 1, single haunch bars that interfere with penetration of mat reinforcing into the haunch shall be relocated to allow penetration. Relocation will be to the nearest adjacent placement opportunity without regard to the 8" spacing module. Clear spacing, however, between haunch bars shall be maintained.
¿ The total number of haunch bars will remain unchanged.
¿ In Zone 1, provide a curved band of reinforcing at the typical size and spacing of the mat within the wall.
¿ Where the angle becomes such that the mat reinforcing cannot penetrate the haunch without relocating more than one haunch bar, reinforcing may terminate at the toe of the haunch. This is labeled Zone 2 in the sketch.
¿ In Zone 2, provide a curved band of reinforcing at the typical size and spacing of the mat within the haunch.
¿ Zone 1 and Zone 2 bands will overlap typical reinforcing by the distance LTS.

From: Shimmick Construction Company, Inc. Chris Williams **To:** Webcor Construction LP Spencer Sayles **Answered By:**

Co-Author:

REQUEST:

Attached is a rebar congestion model of the concourse slab and column C2 at C24.9. As is apparent, the structural steel shear lug portion of the plate embed is in conflict with the reinforcing steel and will not fit with required rebar spacing. The rebar conflicts with he shear lug and blockout that are present, include but are not limited to:

- Typical MFB Beam at C24.9 (blue colored bars in model)
- B-68 Beam (yellow colored bars in model)
- Main concourse slab (pink colored bars in model)
- Column C-2 vertical T-Heads (purple colored bars in model)

Please provide a solution that will provide a constructible blockout and embediment of the structural steel plate.

SHIMM000-0358	**Sump Pit Rebar Tail and Trestle Pile @ GL 18.5/E - Area 9**	**Open**	**10/17/2013**	**10/27/2013**		**Potentially**	☐

From: Shimmick Construction Company, Inc. Ben Gordon **To:** Webcor Construction LP Spencer Sayles **Answered By:**

Co-Author:

REQUEST:

Reference: RFI T-0644

Three of the sump pit lower mat #11 tails near grid line 18.5/E are in conflict wit the nearby trestle pile. The bars have been trimmed to clear the trestle pile and provide an LTE of 34" instead of 60" as required per plans.

Typically, a bent bar would be spliced to the interrupted bar as required in SKS-0281 in the response to RFI T-066; however, the trimmed bars have a 70" length which would not beet the 78" LTS requirement. Gerdau propose to leave the 3 ea trimmed bars as-is and not incoporate an additional spliced bent bar. Please confirm if this is acceptable.

Co-Author:

REQUEST:

Please reference attached detail6 S1-3203, attached detail10 S1-3204, RFI Response T-0453.1, RFI Response T-0835 and attached SKA-2863.
RFI Response T-0835 confirmed that the vehicle bike ramp wall intersects the foundation wall at a 97 degree angle. Where this ramp wall intersects the foundation wall, embeds per detail 6 on S 1-3203 and detail 10 S 1-3204 are required. SCCI and its embed supplier has a constructability concern with these embeds. A similar constructability concern was brought up in RFI T -0453.1, stating that if an angle
member of such thickness is bent to achieve an angle other than that member's stock angle, it will structurally stress that member.

1. Please confirm it is acceptable to weld two (2) 8"x24"x1" plates together in order to achieve angle prescribed in RFI Response T-0835. Reference SKA-2863 for the acute and obtuse angles required. Forthcoming shop drawings will show all welds.

REQUEST:

As per SK RFI 385 response, Skanska has the following comments on the details WO indicated are included in TG07.1R scope:

1) 3 & 6/S1-3412: As no clear scope delineation line is indicated on these two details and the embeds are attached to TG07.1R steel, Skanska will provide the embedded plates for others to install as detailed on 3 & 6/S1-3412 SK1.

2) 3 & 8/S1-7631: Drawing S1-7102 partial plan at Roof Park level has not been issued to date. Therefore framing steel and decking at top of steel elevation 86' 1-1/4" was not included in our bid. Please provide this drawing and allocate a CO number for this work.

3) 8/S1-7602: Although the embedded plate is clearly indicated below the scope delineation line, for erection purposes Skanska will supply the angle with welded connection plate for TG06 to install as per SK2.

4) 1/S1-3705: As no clear scope delineation line is indicated and the embedded plate is attached to TG07.1R steel, Skanska will provide the embedded plate and angle for others to install as detailed as per SK3.

5) 9 & 11/S1-7600: In RFI SK 385 Skanska questioned the scope and erectability of the HHS posts as detailed in 9&11/S1-7600. The scope of the embedded angles was already confirmed by WO as not in TG07.1R scope in RFI T-1067 #6. As 11/S1-7600 occurs between GL1.4 & 2 at the train platform level which has already been poured WO should verify this embed has been installed by TG06 as detailed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1) OK
2) Drawing S1-7102 has not been issued for construction by the design team. It is currently listed as issued for bid. The attached S1-7102 is provided for your reference only.
3) Skanska to field weld 3/8" plate to embedded angle. Embedded angle to be provided and installed by others.
4) OK
5) Details 9 & 11/S1-7600 are not included in Skanska's scope. These embeds noted are to be provided and installed by others. W/O confirms that the train platform level referenced in detail 1/S1-7016 has not been poured yet.

Skanska to include all embeds connecting to structural steel in their Erection Drawings, including embeds provided and installed by others. Please denote "by others" adjacent to embeds not provided by Skanska to facilitate coordination with other contractors. Shear plates and other attachments to embeds provided "by others" are to be provided by Skanska as field welded.

SKAN000-465	SSS - BOD Manufacturer for Standard Paint System	Closed	04/11/2014	04/21/2014	04/11/2014	Potentially	☐

From: Webcor Construction LP Gregory Kemerer **To:** Turner Construction Company Phil Militello **Answered By:** Webcor Construction LP Gregory Kemerer

Co-Author: Skanska USA Civil West California Dis Ryan Clayton

REQUEST:

It is understood through review of the TG07.1R package that no applications of standard paint systems on structural
steel are required at this time. However, in preparation for potential future changes, Skanska is collecting product information for standard paint systems for potential use on the project.

Specification section 05 10 00-2.2.A.1 lists general requirements for structural steel standard primer, but does not list
the basis of design manufacturer(s) for this system. This section refers to the Division 9 specification; however, Skanska has only been issued the high performance coating specification within Division 9. Please provide the basis of
design manufacturer(s) approved for structural steel standard paint coating systems on this project.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Please reference the specifications issued along with TRANSBAY FIELD ORDER 00027 - 100% Main Package Drawings, "Issued for Construction" dated 3/31/14.

Co-Author: Skanska USA Civil West California Dis Ryan Clayton

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REQUEST:

The contract drawings indicate that lift eyes will be provided for shop handling. The lift eyes that were cast into the back side of the ground level cast nodes have now been machined off by Bradken, leaving only the lift eyes inside the nozzles. In order to safely handle these castings, new lift features need to be added to the back side to replace those that were machined off.

It is requested that drilled and tapped holes be added to the back side of the ground cast nodes by Bradken to facilitate safe and efficient shop handling as indicated by the contract drawings.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Note 6 on the Cast Connex drawings indicates "PICKING EYE(S) TO BE LOCATED WITHIN THE INTERIOR OF THE CASTING'S NOZZLE(S)."

Removal of additional lift eyes not within the cast node nozzles is in line with this note. Please note that the picking eyes provided are intended for use in lifting the weight of the cast nodes only, and are not intended to support the weight of any additional material attached subsequently.

T- 0851	BGP - Lower Concourse Shoring/Reshoring Calculation for Construction Live Loa	Closed	10/23/2013	11/02/2013	11/05/2013	Potentially	☐

From: Webcor Construction LP Jackson Tukuafu **To:** Turner Construction Company Gary Krutsch **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author: Shimmick Construction Company, Inc. Scott Bunnell

REQUEST:

Please refer to attached excerpt of Specification Section 03 10 00 - Concrete Formwork - Below Grade Package.

Per Article 3.2, Section A.2 of Spec Section 031000, the minimum construction live load design criteria for shoring and reshoring is 50 psf. The specification section is unclear whether the live load of 50psf is prior to or post concrete placement.

According to D.H. Charles (SCCI shoring designer), falsework projects of this application typically approach the falsework design for 50 psf before concrete is placed and 20 psf afterwards, while always maintaining a minimum design load (dead + live) of at least 100 psf. The attached list of of D.H. Charles project used the this same design approach. Falsework calculations are to follow.

Is the D.H. Charles design criteria acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

George Metzger
11/4/2013
RESPONSE:
Specification 03 10 00: Design of formwork is the responsibility of the contractor. See Section 1.3C for formwork design requirements that include conformance with SEI/ASCE-37 and ACI 347. See Section 3.2 for Shores and Reshores including conformance with ACI 347.2R.

ACI 347.2R typically assumes that the Live Load is associated with the placement of fresh concrete and that the Live Load is removed upon the completion of placement. Depending on the contractors planned use of "working surfaces" and the particular shoring/ reshoring scheme, the Live Load may be more or may be less than the 50psf minimum after placement operations.

Unless measures are taken restrict construction access to specific areas, it is assumed that the entire Lower Concourse will be a working surface and that the contractor will assign an Operational Class per SEI/ASCE-37 Section 4.8.1. Justification for the assumed uniform load will form part of the required submittal.

T-0001	**Article 6 Changes in Work - Clarification**	**Closed**	**10/11/2010**	**10/25/2010**	**11/03/2010**	**Potentially**	☐

From: Webcor Construction LP Joanne Filipas **To:** Turner Construction Company Daphne Faulkner **Answered By:** Turner Construction Comp Daphne Faulkner

Co-Author:

REQUEST:

Reference: Spec Section 00 07 00, Article 6 - Clarifications and Changes in Work

Article 6 in the General Condition specification section 00 07 00 defines the procedure for changes in work. The procedures defined throughout Article 6 are conflicting. According to section 6.01.A, CM/GC shall promptly comply and proceed with changes issued by the TJPA in the form of a Change Order or Field Order. Section 6.02.B states that the TJPA will respond to RFI's with written Clarification deemed necessary and consistent with the Contract Documents or a Field Order requiring minor changes in work. Per section 6.01.A, the CM/GC is to proceed with the Field Order immediately. However, according to section 6.03.A, CM/GC shall submit a Change Order Request within 21 days of written directive. Please advise if the CM/GC is to proceed with changes promptly and prior to approval or if the CM/GC shall receive approval prior to proceeding with any changed Work.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

00 07 00 - 6.01.A specifies that, "TJPA may..order additions, deletions, or revisions in the Work by Change Order or Field Order, CM/GC shall promptly comply with such orders and proceed with the Work,.." [emphasis added]. Under paragraph 6.02.B, TJPA may issue a Field Order in response to an RFI submitted by CM/GC. Under paragraph 6.03A, the CM/GC must submit a COR within 21 days if in the opinion of the CM/GC, the Field Order is considered to be a Change to the Contract.

Therefore, TJPA expects the CM/GC promptly to proceed with Work as may be clarified or directed through a Field Order, unless instructed otherwise. CM/GC has the recourse of submitting a COR when appropriate to do so, within the time limit stipulated. To avoid confusion, TJPA's Field Orders will clearly state whether the CM/GC is required to carry out the instruction promptly. Nevertheless, the CM/GC shall whenever possible incorporate a Field Order directive into the Work with minimal disruption to the planned sequence of activities.

Reference Sheet: C-0001 issued 11/04/10; 301 Mission Interim Screen Wall - General Notes

We are in the process of preparing submittals for this project. In doing so we would like to know what specification division format would be most appropriate for us to submit and track these project documents. Please provide us with the desired specification division format as soon as possible so that our submittals can be processed with the proper efficiency.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

All submittals for the 301 Mission Interim Screen Wall shall be submitted
under the new CSI Division, "301 Mission Interim Screen Wall," that has been
created and is available in Constructware under Transit Center Building
(140). Within CSI Division "301 Mission Interim Screen Wall," there is a list
of available "spec sections" that are equal to the drawing sheet number (and
paragraph heading as applicable) that the submittal is called out on.
If there are multiple "spec sections" on one sheet, the suffix ".X" has been
added. For example, "S-0001.5 Concrete and Reinforcing" shall contain all
submittals found on sheet S-0001 under the heading "Concrete and
Reinforcing."
If there is no suffix , the description of the spec is simply the title of the
drawing.

T-0006	**301 Mission Wall Plywood Wall Barrier Proposal**	**Closed**	**12/08/2010**	**12/18/2010**	**12/17/2010**	**Potentially**	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** Turner Construction Comp Jack Adams

Co-Author:

REQUEST:

Reference: C-5000 and attached sketch

During the Fremont Shoring/301 Mission Wall Coordination Meeting on 12-7-10, it was proposed that a plywood barrier wall be erected in lieu of the triton barrier shown on sheet C-5000 of the 301 Mission Street Interim Screen Wall drawings. This plywood barrier will block the view of the 301 Mission tenants and will allow for the early demolition of the existing screen wall (prior to the construction of the new "interim" screen wall). By doing this it will enable the demolition contractor to start the removal of the deep footings earlier than currently scheduled.

In addition, the deletion of the triton barrier will provide approximately 2' of additional driveway width for 301 Mission. Please review the attached preliminary sketch of the above mentioned plywood barrier and provide engineering/architectural comments and mark ups.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Plywood barrier wall be erected in lieu of the triton barrier as agreed to in the meeting with Millennium Partners. The 8' tall plywood barrier wall shall be constructed in segments such that it can be pushed against the new screen wall at the end of each week to accommodate parking. While in position during working hours it will be mechanically fastened to the pavers and to the structure on the back side in order to prevent it from overturning. The exterior face of the wall will be painted "jet mist" to match the existing wall stone. Pilasters will also be painted on the plywood to match the stucco on the existing wall.

W-O will submit a dimensioned sketch drawing with plan, elevation and bracing details to be submitted by your subcontractor once he has completed design and before he begins construction.

T-0007	**Field Order #2 - Issued for Programwide**	**Closed**	**12/08/2010**	**12/18/2010**	**12/13/2010**	**Potentially**	☐

Co-Author:

REQUEST:

According to today's OAC meeting, the documents issued with FO#W0-002 are intended for project-wide review and not exclusively for the "BSE Contract" as stated in the Field Order. Please confirm.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

All Field Orders issued by TJPA and TJPA Representative to CM/GC in accordance with 00 07 00 are for the complete scope performed by CM/GC. It is CM/GC¿s responsibility to direct the requirements to the appropriate trade subcontractors. WO-002 has been re-issued as WO-002R1 on 09DEC2010 with appropriate language to clarify this issue.

T-0008	**Specification Section 00 04 82 Cert. of Bidder Regarding Debarment and Suspensi**	**Closed**	**12/08/2010**	**12/18/2010**	**12/10/2010**	**Potentially**	☐

From: Webcor Construction LP Joanne Filipas **To:** Turner Construction Company Daphne Faulkner **Answered By:** Transbay PMPC Alfred Lau

Co-Author:

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REQUEST:

Per the TJPA, specification section 00 04 82, Certification of Bidder Regarding Debarment and Suspension, shall no longer be used. Please confirm.

If this is in fact true, please confirm this section will be removed from the project specifications.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Section 00 04 82 ¿ Certification of Bidder Regarding Debarment and Suspension reflects the City procurement requirement. With the current project funding arrangement, meeting USDOT procurement is needed, Section 00 08 13/APA - 25 ¿ Certification Regarding Debarment, Suspension, and Other Responsibility Matters will be used in lieu of 00 04 82, and 00 04 82 will be deleted per Field Order WO-01, which is expected to be issued this week.

T-0009 **301 Mission Wall Storage Location for Planter Boxes of 301 Mission Wall** **Closed** **12/10/2010** **12/20/2010** **12/13/2010** **Potentially** ☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** Transbay PMPC Alfred Lau

Co-Author:

REQUEST:

Reference: 301 Mission Interim Screen Wall Drawings Sheet C-1000

On sheet C-1000, there is a note for the (E) Planter boxes that says "(e) precast planter box (typ) to be remove and stored". Please designate a location for storing the (E) planter boxes.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The planter boxes are to be stored for re-use in front of the final screen wall. The timing of construction for the final wall needs to be after the train box is complete, but does not have to wait until the new Transbay Terminal is open for bus operations. Millennium did not agree to providing storage on their property.

Please provide for space on Lot M to store the boxes and inform the contractor accordingly.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
T-0009.1	301 Mission Wall Storage Location for Planter Boxes of 301 Mission Wall	Closed	12/17/2010	12/27/2010	12/29/2010	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** Turner Construction Comp Jack Adams

Co-Author:

REQUEST:

In Transworld's review of the existing planter box condition at the 301 Mission Screen Wall, Transworld's viewpoint after close inspection of the site is that the planter boxes were originally installed with the intent of being permenant fixtures. There are connection points for these planter boxes that appear to be initial anchor points for original placement of these fixtures and there is concern that these planter boxes were never intended to be reinstalled/relocated after the initial installation. With all do skill and care, Transworld intends to relocate these planter boxes with mininmal damage. As a point of advisement, since these boxes do not appear to be designed for relocation, Transworld is concerned that such action will render these boxes unuseful. Please confirm that the design is to relocate these boxes in lieu of replacing them with new ones.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The intent is to salvage and store these boxes in lieu of replacing them with new ones. Per Contract Drawing C-2000 Contractor is to cut and cap all existing irrigation and electrical lines feeding planter boxes. Contractor can remove plants and dirt if needed to uncover and remove anchorage, then salvage precast planter boxes.

T-0013	BSE IFC Table of Contents Discrepancy	Closed	01/05/2011	01/15/2011	01/11/2011	Potentially	☐

From: Webcor Construction LP Joanne Filipas **To:** Turner Construction Company Daphne Faulkner **Answered By:** Transbay PMPC Alfred Lau

Co-Author:

REQUEST:

Ref IFC TOC dated 12/15/10 (attached)

We have received the revised Issued for Construction (IFC) drawings and specifications for the BSE package. The table of contents has check marks to indicate added specification sections. Specification section 02 41 19, Pile Removal is not noted with a check mark but a revised specification was issued. The excavation and backfilll (31 23 10) section was not re-issued, however, a check mark is next to it.

Also, the revision logs at the end of each section need to be revised to show only the revision number and dates.

Please advise and re-issue.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. 00 01 10 Rev 3 and 00 01 15 were released to W/O on 07JAN2011, rectifying issues cited in the RFI.

2. Since it is TJPA/PMPC's opinion that the formatting of the revision box for the technical sections is adequate and appropriate as is. Change to match the abbreviated version of the Div. 00 and 01 sections should be formally requested by W/O such that Design Team and TJPA/PMPC could fully review that and agreed to from a QA/QC point of view.

REQUEST:

Reference: Attached submittal package TG1901-001 review comments and letter from concrete supplier

Per the comments received on the concrete mix design

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Comply with contract documents "Concrete and Reinforcing" Note number 6 on Sheet S-0001, which states:

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

submitted in submittal package TG1901-001, please confirm that the admixture for air entrainment shall be compliant with ASTM C260.

Transworld has been informed by their concrete supplier that ASTM C260 requires a mix of 6% air entrainment and such amounts of air entrainment are specified only in freeze/thaw areas for durability. The Bay Area is generally not considered a freeze/thaw area and therefore a mix with 6% air entrainment is not typically used. The concrete supplier, Bode Concrete, has provided a letter from BASF related to this specific issue.

"Maximum water/cement ratio shall not exceed 0.45 by weight, slump shall be two to six (2"-6") inches. A water reducer or superplasticizer may be added on site after the slump is verified by inspector. Entrained Air: 6% +/- 1-1/2% for durability."

T-0018	BSE - Waler to CDSM Wall spacing	Closed	01/14/2011	01/24/2011	01/24/2011	Potentially	☐

From: Webcor/Obayashi Joint Venture Masashi Kojima **To:** Turner Construction Company Daphne Faulkner **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

There may be a potential conflict with the walers and the train box reinforcement. Spec 31-55-00 allows 6" minimum spacing from CDSM Wall to face of waler, but based upon

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Thornton Tomasetti Response: It is permissible to use mechanical couplers for the vertical reinforcement interrupted by the whaler for the condition where

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Balfour Beatty past experience with a very similar situation, it is felt that the 6" space is not sufficient because of the following:

1. There does not appear to be enough room between the bottom of the waler and the CJ for a lap splice of the vertical reinforcing as depicted on sheet S -3201. Reference the attached drawing.
2. The 6" gap is difficult to snake reinforcement through without damaging the waterproofing attached to the wall.

BBI recommends making the space between the face of the CDSM wall and the waler equal to the wall thickness. This would eliminate conflicts with the rebar and walers, reduce reinforcement splicing and reinforcing congestion.

Additionally attached is an example where the space behind the waler was equal to the wall thickness.

Please advise whether to continue the design with the current 6" minimum space or advise if the space increases.

whaler is 6" min away from CDSM wall.
The proposed increase in whaler to CDSM wall spacing concept is acceptable by TT regarding the Trainbox wall, pending Arup's evaluation/comments. Submit details of revised scheme for review.
ARUP Response: The design team cannot comment on the impact of the Contractor's proposal, without seeing more details of the shoring wall internal bracing system and associated proposed details.
Adamson Associates Response: The proposal cannot be evaluated based on the limited documents submitted. However, it appears that the bracing and attachments shown in the drawing attached to this RFI will need to be modified to allow for the waterproofing system to be appropriately installed as the Wale system is removed.

T-0019 **301 Mission Wall - Stone Panel Anchorage to 301 Mission's Screen Wall** **Closed** **01/18/2011** **01/28/2011** **01/31/2011** **Potentially** ☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Kevin Chiu **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: Attached pages from the 2008 Building Code

After removing stone panels in the demolition of the original 301 Mission Wall, the existing system of the stone panels does not utilize an anchoring system for mounting the stone panels to the wall. In addition, section 6.2.2.4 of the 2008 Building code does not specify mechanical fasteners for masonry less than 2-5/8" thick. The stone thickness used on the new wall will match the thickness of the existing, which is approx 10mm thick. Therefore, according to section 6.3 of the 2008 Building Code, the stone panel system for the Transbay Interim Screen Wall that should be used is the adhesion application.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Proposed anchorage system can not be evaluated prior to inspection of the retained stone sample.

Please provide retained samples of stone from the demolished 301 Mission Street Screen Wall in order to confirm dimensions of the existing stone and evaluate proposed anchorage system.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Please confirm that Transworld can use the adhered method for the stone panels in lieu of mechanical fasteners.

T-0019.1 **301 Mission Wall - Stone Panel Anchorage to 301 Mission's Screen Wall** **Closed** **02/07/2011** **02/17/2011** **02/10/2011** **Potentially** ☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Kevin Chiu **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: RFI T-0019 and attached photos

RFI T-0019 requested samples of stone from the demolished 301 Mission Street Screen Wall in order to verify thickness of the stone that will be used on the wall, and confirm that a mechanical system had not been used to mount the stone. A sample has been shown to URS and pictures of that sample are attached to this RFI. Please confirm that mechanically fastened panels are not necessary and that a thin set adhesive application will be an acceptable means to setting the stone on the new screen wall.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Mechanical fastening of matching stone panels is not required. Location of face of stone as shown on A-6000 detail D is a contract requirement. Please provide complete detailing of proposed attachment of stone and how the location of the face of stone will be achieved using thinset.

T-0024	Re-bracing for Revised SW Corner Alignment	Closed	02/02/2011	02/11/2011	02/11/2011	Potentially	☐

From: Webcor Construction LP Nhi Tran **To:** Turner Construction Company Daphne Faulkner **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

Reference Sheet GT-1112 and Specification Section 31 55 00

The response to RFI T-0017 showed a revised CDSM wall alignment at the SW corner of zone 1 and the addition of the structural shear walls on wall X1-1. The RFI response implied that BBII's cross-lot bracing needed to be re-designed so there are no conflicts with the concrete columns and shear walls. In order to minimize the cost and impacts as a result of this change, BBII suggests using rakers for the re-bracing in this corner.

The cross lot bracing would be installed as specified for the initial excavation (ref stage 10 on GT-1112) similar to the layout shown on the attached sketch #1.

Then for the re-bracing stage 12 and stage 15 rakers could be used in locations shown in attachment sketch #2.

Would a design based on this concept be acceptable?

If not, BBII is available and willing to brainstorm additional ideas.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ARUP Response:

The use of rakers as rebracing is acceptable provided the design criteria specified in the construction

documents is satisfied. This includes, but is not limited to, the bracing stiffness requirements. The

effective stiffness of the rakers will be affected by the stiffness of the permanent train box wall and

mat slab and tiedowns.

The response to this RFI must include input from Thornton Tomasetti regarding the impact on the

permanent structural elements.

As discussed at the Feb 9, 2011 TG03 BSE Subcontractor - Design Team Coordination Meeting, it

may be possible to reduce the requirement for rebracing if the permanent trainbox shear walls can

be built sequentially and their construction coordinated with the removal of struts. Arup suggests a

meeting with Arup, the Contractor, and Thornton Tomasetti as this requires an understanding of the

proposed construction sequence and an evaluation of the permanent structural elements.

Thornton Tomasetti (TT) Response: We have review the response by Arup, and found this is consistent with our prior discussion with Arup. No further comment from TT is needed.

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: RFI T-0027

Please confirm that per site walk on 03/22/11 with Danny Lo and Erik Liu of Transworld, David Hungerford with Webcor-Obayashi, and David Fyfe and Christine Baudier of URS, that the layout of the core holes for the #8 dowels in the concrete wall are acceptable.

RFI T-0027 included a response sketch directing dowels to be in line and set 6" from the south face of the existing wall below. Due to the existing condition of the wall below, which was poured aginst a shoring wall and therefore not exactly straight, the dowels are laid out to be in line with each other and therefore vary in dimension measured off of the south face of the existing basement wall below. Please confirm, as it is understood, that the existing layout is acceptable. Dowels are being set in epoxy today, so an immediate response is requested.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

It was verified in the field that #8 dowels were drilled approximately 6" from the exterior face of the existing vault wall and that #8 dowels will have a minimum 2" concrete cover.

The layout of the #8 dowels is acceptable.

T-0028 **BSE - Bracing Stiffness Calculation Confirmation** **Closed** **02/08/2011** **02/18/2011** **02/09/2011** **Potentially** ☐

From: Webcor Construction LP Nhi Tran **To:** Turner Construction Company Daphne Faulkner **Answered By:** Arup Kevin Clinch

Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

Reference Specification Section 31 55 00 and attached sample calculations

The response to pre-bid RFI #TG0300-058 provided an equation for calculating the stiffness of the bracing system. Attached is BBII's designer's sample "template" calculation for stiffness for the proposed waler and strut bracing system.

BBII requests a confirmation that the designer's interpretation and use of the provided stiffness calculation is correct, prior to progressing further submittal calculations and procuring steel bracing members.

Additionally, BBII requests an expedited response to this RFI.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The methodology shown in these calculations for determining the internal bracing system stiffness is consistent with that shown in response to pre-bid RFI #TG0300-058.

Complete details of the internal bracing system were not included in the RFI. It is therefore not possible to conclude that all elements affecting the stiffness of the internal bracing system have been considered and included in the analysis.

These calculations have not been reviewed for conformance with other design criteria. A more complete review will be undertaken when the calculations are issued as a submittal.

T-0029	**301 Mission Screen Wall - Sub Surface Structure Conflict with New Wall Location**	**Closed**	**02/09/2011**	**02/19/2011**	**02/18/2011**	**Potentially**	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Kevin Chiu **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: Photograph attachments 1-8

In laying out the location of the new concrete wall, Transworld has determined that the new concrete wall will extend over existing sub-surface structures, which is not per the contract documents. Please reference attached photos.

First, there are two manhole covers that are incorporated in concrete rings. These rings conflict with the location of the new wall and are included in photographed attachments. Due to the size of these concrete rings, a portion of the ring will be buried by the new wall. Second, the steel frame of the existing electrical vault doors is of similar condition as the manhole covers; this condition can also be seen in the photographed attachments.

Please confirm that Transworld is to proceed with the plan location of the new concrete wall which will cover and bury a portin of these existing sub-surface structures.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

To accommodate unforeseen location of existing structures, new concrete wall to be shifted south so that the south face of new concrete wall is flush with the exterior face of the existing 301 Mission street basement perimeter wall.

Interfering regions of existing sub-surface structures (manhole rings and vault sides) at the base of new concrete wall shall be incorporated into new concrete wall. All surfaces of interfering concrete regions to be incorporated into new concrete wall shall be prepared as bonded construction joints. Verify functioning of manhole and vault lids/openings are not obstructed by new concrete.

Contractor to provide chalk line at updated south and north faces of new concrete wall for verification of updated location in field by TJPA representative prior to construction of new concrete wall.

See attached RFI coordination sketch.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
T-0030	301 Mission Screen Wall - Detail required for concrete sleeve installation	Closed	02/09/2011	02/19/2011	02/18/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Kevin Chiu **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: Attached 1/C-5001 and photo

The existing condition of the manhole covers are not consistent with the contract documents. Detail 1/C - 5001 indicates that the existing manhole sits above an existing concrete slab, to which is to be drilled into with 1 inch embedment. However, please refer to the attached photograph in attachment 1 which shows the manhole cover is actually a part of a subsurface concrete ring assembly, and wrapped with waterproofing. Please provide a new detail and instructions for the installation of the required concrete sleeve and a detail for penetrating the existing waterproofing.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Per contract documents;

Remove manhole lid;

Retain existing concrete and steel collar/frame;

Dowel into existing concrete collar/frame (1" max) with #3 hoops @ 10" O.C.;

Prepare existing concrete surfaces to be incorporated into new sleeve as bonded construction joints;

Cast in place 6" thick concrete sleeve directly over manhole (concrete and steel collar/frame);

Provide Kadee SS 1/8" circular grate satin finish.

T-0030.1	301 Mission Screen Wall - Concrete sleeve installation	Closed	02/24/2011	03/06/2011	03/03/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: RFI T-0030

The final measurement from the edge of the steel collar/frame at the existing manholes to the face of new wall is (+/-) 4-3/4", this dimension less form material (+/-) 3/4" to 1", results in the new cast in place concrete sleeve to be 4" thick at the point closest to the wall . Response to RFI T-0030 notes that the sleeve is to be 6" thick. Please clarify if the 4" thickness is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

4" minimum thickness acceptable only where new CIP concrete sleeve is in conflict with new interim screen wall. Remaining portions of new CIP concrete sleeve not in conflict with new interim screen wall shall be 6" thick per contract documents.

Contractor shall provide 3/8" expansion joint material between face of new interim screen wall and outside face of new CIP concrete sleeve.

See attached coordination sketch.

T-0031	301 Mission Screen Wall - In-ground lighting	Closed	02/09/2011	02/19/2011	02/21/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Kevin Chiu **Answered By:** URS Corporation David Fyfe

Co-Author:

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REQUEST:

Reference: Note 10 on C-2000

The new in-ground lighting as anticipated in plans and note 10 on page C - 2000 must be substituted because the contract design cannot be accommodated in the new construction. The contract design requires:
1) that the new lighting match the existing with the same model and size.
The issue here is that the existing light fixtures are larger than can be accommodated within the thickness of the new construction.

2) that the existing electrical lines servicing the existing lights be disconnected so that it is reconnected to the new lights.
The issue here is that the electrical lines for the existing light fixtures are embedded in the concrete curb that is to be removed. Upon removal of the existing concrete curb, there will be no existing electrical lines to reconnect for the new lighting power.

Please provide a new detail and instructions for the in-ground lighting.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Additional information is required to understand/interpret existing conditions and facilitate a response to this RFI.

Please provide all available information on existing conditions that pertain to this RFI, including but not limited to the following;

1. type, model, size and manufacturer of existing light fixtures;
2. type and size of existing electrical conduit/conductor;
3. sketch illustrating alignment of existing electrical conduit/conductor, including junction boxes, termination points and power source; and,
4. sketch illustrating thickness of existing/new construction where new lights are to be set/placed.

Number	*Subject*	*Status*	*Date Created*	*Date Required*	*Date Answered*	*Cost Impact*	*Proceed*
T-0031.1	**301 Mission Wall - In-ground lighting**	**Closed**	**03/31/2011**	**04/10/2011**	**04/06/2011**	**Potentially**	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: Attached photos and sketch

Response to RFI T-0031 requested additional information.

1. See the attached pictures for the information known about the lights that were removed.
2. The existing conduit is 3/4"
3. Attached is a sketch and a photo showing the approximate location of the existing conduit.

There is one existing conduit on the south side of the wall protruding from the soil coming from the basement wall. The electrical conduit is approximately 6 feet east from the western transformer vault vent opening. Attached you can see the pictures of this conduit that is currently sticking out below the scaffolding planking.

4. Please advise the location and mounting details for the new lights.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

We note that the Contractor has installed new electrical conduit and outlet boxes within the new concrete wall.

To document the as-built conditions of all work and to verify conformance with all applicable codes and standards, Contractor shall submit drawing(s) illustrating full routing of all conduit(s), including alignment, conduit material type, couplings/fittings, outlet boxes, etc. Drawings shall detail the connection between existing electrical line and new electrical line and connection between new electrical line and new lights/fixtures.

Drawings shall be sufficiently detailed to document all electrical work is in conformance with all applicable codes and standards, and shall be sufficient for permitting and/or inspection of electrical work.

All conduit and/or boxes shall be set so as to provide minimum 1¿ clear from all rebar, anchor bolts or other embedded structural steel items. Outlet boxes located in new concrete wall shall be fully coordinated for direct connection with the new light(s)/fixture(s).

It is our understanding that the existing 301 Mission driveway/roadway section (approximately 3¿ paver over 1¿ sand bed over 4¿ to 8¿ concrete topping slab) does not allow use of new lights/fixtures matching original lights/fixtures. It is recommended use of the Ligman Paragon square 186mm (50338-N-35) light/fixture, or approved equal, in lieu of the original light/fixture (Hydrel M9410). The new Ligman Paragon square light fixture (or equivalent fixture) shall be placed adjacent to new concrete wall and shall be mounted exposed above ground (not in ground) with the base of new light fixture located aligned to top of paver(s). See attached coordination sketch.

Please confirm the use of Ligman Paragon square 186mm (50338-N-35) light(s)/fixture(s) can be fully coordinated with all work.

See attached product data for Ligman Paragon square 186mm (50338-N-35) light/fixture.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

In addition, in response to item 2 of RFI No.T-0031, Contractor please coordinate with 301 Mission Building management to ensure that the new light shall be connected correctly to the existing power supply.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
T-0031.2	301 Mission Wall - Light Fixtures	Closed	06/29/2011	07/09/2011	07/13/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: Attached light specs

Per field conversations with 301 Mission staff, the light fixture proposed in response to RFI T-0031.1 is not acceptable. Webcor-Obayashi has coordinated with 301 Mission management personnel and the lighting attachment to this RFI has been requested by 301 Mission. Confirm that the attached light specs are to be installed at the stucco slot locations.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

URS provided four lighting options to Webcor-Obayashi on April 22, 2011 to coordinate with 301 Mission management personnel. It is noted that the lighting attachment to this RFI (Allscape BL-81) is similar to one of the four lighting options provided by URS (Allscape BL-80).

The Allscape BL-80 model (with 39 watt/240 volt, metal halide lamp and prismatic tempered glass lens) was selected by URS because it provides photometric qualities and operating electrical amperage comparable to the original lighting fixture (Hydrel M9410, 35 watts/277 volt, metal halide lamp).

It is noted that the lighting attachment to this RFI, Allscape BL-81 model (with 150 watt/277 volt, metal halide lamp and prismatic tempered glass lens) may provide photometric qualities and operating electrical amperage not similar to the original lighting fixture. It is also noted that the Allscape BL-81 model luminaire is 14.5" wide, which is greater than the 14" width stucco slot(s) specified in the contract documents.

Prior to order and/or installation of the lighting attachment to this RFI (Allscape BL-81, 150 watt/277 volt metal halide lamp) Contractor to confirm the following;

301 Mission building existing electrical circuit/feed that is to be used is sufficient to handle electrical load required by the Allscape BL-81, 150 watt/277 volt metal halide lamp(s);
14.5" width of the BL-81 luminaire(s) can fit within the stucco slot(s) constructed, note contract documents specify 14" wide stucco slot(s); and
photometric qualities of 150 watt lamp (e.g. lighting intensity/brightness) is acceptable to/preferred by 301 Mission management personnel.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author:

REQUEST:

Reference: Attached photo

See attached picture of 301 Mission Screen Wall construction in progress. This picture was taken Nov of 2008, and shows a lateral support tie beam below grade connected to each vertical steel member of the screen wall. These tie beams are not shown on the plans and need to be cut so that the existing wall can be removed by others, as this scope is below and out of Transworld's contract. Please provide details for this condition.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

RESPONSE 02/16/2011 per David Fyfe

Tie beams shall be saw cut cleanly at exterior face of existing 301 Mission street basement perimeter wall.

Restoration of waterproofing is required.

Detail 1 on attached 301 Mission Street drawing S3-3.13 (rev 6, 04/04/2008) is the best available information at this time and has been provided for your information.

RESPONSE 02/23/2011 per Kevin Chiu

Pending approval by the TJPA, a CR will be issued.

T-0033	301 Mission Screen Wall - Concrete Demo Scope of Work Clarification	Closed	02/14/2011	02/24/2011	02/25/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** Turner Construction Comp Jack Adams

Co-Author:

REQUEST:

Reference: attached text document

Please see attached text document explaining Transworld's request.

Transworld Construction requests that TJPA, Turner Construction, and Webcor-Obayashi make a final determination as to work scope based on the documents and discussions provided herein. It is Transworld's contention and belief that the 301 Mission wall relocation work scope does not require Transworld to remove the (e) concrete structure below the dark gray colored curb. For clarity see Exhibit D, page 1 and page 2.

Attached please see text explanation and Exhibits A, B, C, and D.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Response from David Fyfe on 2/23/11:
Removal of element is in scope per contract documents, see detail B on sheet C-5000.

Response from John Adams on 2/24/11:
1. Demolition scope Utility Vault "foundation" to be demolished by Evans Bros see attached sketch C-5000 Detail A.
2. Existing "Concrete Slab" in accord with attached sketch C-5000 Detail B - this element is in scope and is to be removed by Transworld per C-5000 Detail B including concrete as shown.
3. Demolition scope "unforeseen grade beam" to be severed by Evans Bros see attached sketch C-5000

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Detail B.

T-0034 **301 Mission Screen Wall - Change of walkway from original logistics** **Closed** **02/14/2011** **02/24/2011** **02/22/2011** **Potentially** ☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

The conditions of the worksite have changed significantly from what Transworld originally bid and have changed the entire logistical plan for the execution of this contract work. The original logistics plan, as well as the contract documents, show a walkway along the South side of the original existing screen wall. Now, the entire walkway has been removed and nothing exists except an open pit. Please see all four pages of Exhibit A that is attached to this RFI. This change of condition affects Transworld's ability to execute the contract work. There is no longer available workspace to erect the structural steel and the South side finishes. This condition now requires a modification to our contract such that Transworld may use the parking/driveway on the North side of current barricaded area. The exact impact is not yet fully developed because there are ongoing discussions related to further demolition and removal of concrete structures that currently exist for our construction work. If the current and remaining working areas are further deteriorated by additional demolition, even greater challenges will arise. Transworld Construction requests reasonable accommodations for access to the worksite from the parking/driveway that is North of the currently erected temporary barricade wall.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

301 Mission Street driveway shall remain open to building tenants/occupants for through traffic at all times.

Per 2/17/11 field meeting, if coordinated with and approved by 301 Mission Street property owner in advance, one lane of driveway may be temporarily used short term by contractor for deliveries.

Contractor shall prepare and submit a Logistics Plan to the TJPA Representative and 301 Mission Street property owner for review and approval prior to use of driveway. At a minimum Logistics plan shall include the following;

- scheduled dates and duration of driveway use;
- traffic control plan/sketch (including extent of driveway to be used, proposed/required signs, barricades, flagmen, etc.); and,
- extent of temporary barricade wall dismantling and restoration.

Contractor shall provide all necessary traffic control measures (signs, barricades, fencing, flagmen, etc.) during use of driveway as directed by the TJPA Representative and/or 301 Mission Street property owner.

Contractor shall restore temporary barricade wall at end of each day if dismantled.

T-0035 **BSE - Additional Trainbox Drawings** **Closed** **02/16/2011** **02/26/2011** **02/22/2011** **Potentially** ☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

Reference Sheet S-3201 and Specification Section 31 55 00

BBII believes that they do not have enough detailed drawings of the Train Box to properly design a conflict-free bracing system. BBII states that the architectural sections A1-6000 through A1-6231 lack detail regarding dimensions of structural components (i.e. beams, walls, ramps and etc.). The only structural section BBII currently has is on S-3201 and there appears to be a beam running along C line, however that beam is not identified in the table.

BBII is requesting additional structural section and elevation drawings, specifically:
- A dimensioned longitudinal elevation of the entire trainbox, showing the most current location and depths of beams.
- Full cross section of typical trainbox as well as any other non typical section. Shown any cross slopes, high and low points of concrete.
- Detailed sections of the SW corner showing dimensions and elevations of any ramps or locations where there are on ground floor slabs.

BBII would prefer CAD files if possible, however hardcopies will work.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The design of the permanent structure inside the shoring wall is in progress and subject to change. At 50% Construction Documents on December 20, 2010 an in-progress 3D REVIT Program Computer Model was issued to TJPA and TJPA shared this model with W/O for informational purposes on the progress of the permanent structure design. We suggest that for reference only, W/O review the possible locations for shoring struts with the in-progress 3D REVIT Program Computer Model. This 3D REVIT Program Computer Model provides more information than you would receive in the limited number of sections requested above.

From: Webcor Construction LP Nhi Tran **To:** Turner Construction Company Daphne Faulkner **Answered By:** AECOM Technical Servic Eric Zagol

Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

Reference Sheets U-2021 to U-2023, U-4005

BBII is requesting as-built data for the phase 1 electrical ductbanks at First St. and Fremont St. BBII is particularly interested in receiving the coordinates, elevations, width and depths of the ductbank where they intersect the CDSM wall as shown on utility drawings U-2021 through U-2023

Additionally, BBII would like to receive more info on the phase 2 utilities shown in section X&Y on U-4005:
- What material are these ducts and are they encased?
- Can the spacing shown on U-4005 be shifted to accommodate bridge girder spacing?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Phase I electrical ducts as shown on the AECOM Relocation of Utilities Project (RUP) Plans sheets U-2020, U-2021, U-2022 and U-2023 on First and Fremont streets have been constructed or will be constructed by PG&E. AECOM has requested as-built information from PG&E on what has been constructed to date and will provide upon receipt.

Sections X and Y on RUP sheet U-4005 shows utilities in the proposed final locations following construction of the Transit Center substructure and permanent utility corridors on First and Fremont streets. Not all utilities shown need to be incorporated and supported by the interim bridge structures on First and Fremont streets.

Only PG&E and Verizon Phase II utilities need to be incorporated and supported from the interim bridge structure. The remaining utilities i.e. AT&T, TCG and PG&E "NIP" (PG&E New Bushiness) indicated in section, will be constructed following construction of the Transit Center substructure and permanent utility corridors.

PG&E has proposed steel conduit for the ducts to be supported by the interim bridge structures. Verizon has proposed PVC conduits.

Proposed modifications to utility alignments (horizontal and vertical) and conduit configuration may be acceptable upon review and acceptance by AECOM and the private utility. AECOM suggests a coordination meeting between BBII, AECOM and the

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

private utilities to help facilitate the interim bridge and utilities support design.

T-0038	BSE - Shear Walls for Rebracing	Closed	02/17/2011	02/27/2011	02/22/2011	Potentially	☐

From: Webcor Construction LP Nhi Tran
Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal
To: Turner Construction Company Daphne Faulkner
Answered By: Adamson Associates, Inc. George Metzger

REQUEST:

Reference response to RFI #T-0024, Sheet GT-1112, and attached drawing

The response to RFI #T-0024 noted discussions that took place during the TG03 BSE Trade Subcontractor - Design Team Coordination Meeting, about utilizing the permanent shear wall as re-bracing during the train box build out.

Attached is a sketch showing a staged wall construction and strut removal sequence that BBII believes would eliminate the need for re-bracing along the SW Wall.

Is this sequence acceptable?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Thornton Tomasetti Response:

The conditions depicted in Stage 12 & 13 of sketch GT-1112 for shearwalls to be used as re-brace elements will cause overstressing of the mat slab and excessive movement of the Trainbox wall, and therefore, is not acceptable. Note however, that once the Lower Concourse slab is constructed and develops the design strength, the upper portion of the shearwall above the Lower Concourse slab can be used as re-braces. See attached SKS-0101 that illustrates the load path of the shearwall.

ARUP Response:

The use of the permanent concrete shearwalls as bracing is acceptable provided the design criteria specified in the construction documents is satisfied. This includes, but is not limited to, the bracing stiffness requirements. The effective stiffness of the shear walls will be affected by the stiffness of the permanent train box wall and mat slab and tiedowns.

The response to this RFI must include input from Thornton Tomasetti regarding the impact on the permanent structural elements.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
T-0038.1	BSE - Shear Walls for Rebracing	Closed	11/06/2014	11/16/2014	11/17/2014	Potentially	☐

From: Webcor Construction LP Claude Titche **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author:

REQUEST:

Reference RFI T-0038.

The response to RFI T-0038 states that once the Lower Concourse has reached design strength the permanent shear walls can be utilized as re-braces. The response also contains a sketch detailing the load path of the shear wall, however the sketch details the Lower Concourse shear walls being poured up to the foundation wall. The design has evolved since and the contract drawings now show a corridor running along the southwest corridor creating a gap between the shear wall and foundation wall. Please clarify the design intent and confirm shear walls can be used as re-bracing per contract document.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The response to RFI T-0038 stands. The purpose of conceptual sketch SKS-0101 is to illustrate acceptable and unacceptable reaction force couples. The sketch does not speak to the adequacy, detailing, or completeness of the load path for the excavation shoring, including the presence or absence of a corridor. The contractor is solely responsible for excavation shoring and protection of the structure in all temporary conditions. This includes all required calculations, detailing, and verification of completeness and adequacy of load path. Provided the contractor has fulfilled this obligation, the shearwalls may be used as rebracing, as was stated in RFI T-0038 response.

T-0039	301 Mission Screen Wall - Base Plate Dimensions	Closed	02/17/2011	02/27/2011	02/23/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: 2/S-5000, D/S-5000, attached sketches

See the 301 Mission Screen Wall drawings, specifically details 2 and D/S-5000. Is it acceptable to use a base plate with dimensions 14" x 14", in lieu of the 14" x 18" per plan below the HSS 10" x 10"? See attached sketches of proposed anchor bolt mounting options A and B. If acceptable, please choose the detail you prefer.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Neither options A nor B are acceptable for the anchor bolt mounting system. Provide a base plate as detailed on S-5000 that has the dimensions of 14" by 18".

T-0040	BSE - Proposed Bracing Removal Sequence	Closed	02/22/2011	03/04/2011	02/23/2011	Potentially	☐

From: Webcor Construction LP Nhi Tran
Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal
To: Turner Construction Company Daphne Faulkner
Answered By: Adamson Associates, Inc. George Metzger

REQUEST:

Reference Sheet GT-1112 and attached proposal

Attached is a proposed sequence for bracing removal that involves removing the two lower layers of bracing after the structural slab and fillets are poured. BBII's shoring designer has done analysis at each stage of construction (see attached). The results show that removal of the two lower levels after the slab has been poured produces less deflection than the fully excavated condition. The results are summarized for case west and case east on page 18 and 36 respectively.

BBII believes this proposed sequence provides a tremendous value to the overall project by:
- Eliminating the coordination between the bracing and concrete trade subcontractors during the construction of the lower walls and concourse slab
- Eliminates a horizontal construction joint in the lower wall which significantly reduces construction cost and duration.
- Allows for better waterproofing product, by eliminating a construction joint and reduces patching of the membrane around shoring elements
- Allows for unobstructed construction of the lower walls and soffit shoring of the concourse level slab, which also reduces construction cost and duration

BBII is requesting evaluation by TJPA's design team to determine if this sequence is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ARUP Response:

The question in this RFI is a substitution request and should be submitted following the appropriate procedures outlined in the specifications.

Considerable time and coordination between the design team members is required to properly evaluate the suggestion. Arup will continue to study the issue. We understand it will be a topic of discussion at the March 1 TG03 BSE Subcontractor - Design Team Coordination Meeting.

T-0042	**301 Mission Screen Wall - Elevation of concrete wall**	**Closed**	**02/24/2011**	**03/06/2011**	**03/10/2011**	**Potentially**	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Please clarify the following information regarding the field elevation of the new concrete wall. Detail A/S-4000 indicates that the concrete foundation wall height shall be +/- 2'- 2" to 2'- 8". Based on this reference the tallest part of the concrete wall will be the East point of the wall. The height of the wall will then decrease as the wall moves west towards Fremont St. (the west side). If we use a wall height of 2'- 8" at its tallest point (the east side), that would result in a wall height of 20.5 inches at Fremont Street (the west end). This is less than 2'-2" as indicated in the contract drawings; therefore please confirm that Transworld will be building a concrete wall height between 20.5 inches to 2'- 8". As a point of comparison, the original existing screen wall had this exact same dimension of 20.5 inches at the low and 2'- 8" at the high.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

New concrete wall height of 20.5" above the existing embed plate on west end is not acceptable.

Contract documents show the new concrete wall height varies from 2'-2" +/- to 2'-8" +/-. This is based on the driveway elevations shown on the existing plans provided by Millennium Partners, developer for 301 Mission Street, and allowing for a code required minimum 18" high concrete wall from top of paver/driving surface for vehicle safety. As noted on A/S-4000, "Top of (E) Vault Wall Elevation may Vary, Contractor to VIF, Adjust Concrete Wall Accordingly", please adjust top of concrete wall to be minimum 18" above top of paver/driving surface (approximately 2'-4" +/- to 3'-4" +/- in wall height).

See attached coordination sketch.

T-0043	301 Mission Screen Wall - Temporary Vault Plug at Utility Vault Opening	Closed	02/25/2011	03/07/2011	03/23/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Regarding the transformer vault plug as shown on page C-5000; Transworld has been asked to submit some proposals as to how a plug should be installed. The original existing ventilation for the vault was open to the air at the original planters. This original ventilation was completely open and secured only by a metal grate to prevent access, but not water or air. As located on page C-5000, Transworld construction proposes to install 2 x 4 backing studs attached to the left and right vertical walls of the existing opening. These 2 x 4 backing studs will be adhered with powder actuated nails. Spanning across the backing studs Transworld construction proposes to install two 2 x 4 crossmembers which will be nailed to the 2 x 4 backing studs. This assembly can be seen in the attached pictures pages 1 and 2.

The assemblly noted above is option 1.
Option 2- Added additionall 2x4 crossmembers which would further restrict air flow to the (e) vault.
Option 3- Nail on a plywood sheet that would enclose the entire vault vent opening.
Option 4 - Nail on a plywood sheet and waterproof the plywood to prevent water intrusion as well.

Note: Transworld Construction is concerned about restricting airflow into a vault that originally was designed to have this open vent. We are not familiar with any impact sealing this vent will have on the existing equipment.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Contractor shall provide the transformer vault plug based on the Option 4 solution with the following amendments;

1. Provide 2x4 cross members at max. 12" o.c. spacing;
2. Face of all 2x4 members shall be flush with outside face of existing vault wall to facilitate extension of plywood sheet beyond ventilation opening (see number 5 below);
3. Plywood sheet shall be two layers of 5/8" for a total of 1.25" thick, laminate plywood layers with waterproof adhesives;
4. Secure plywood to 2x4 members with galvanized nails or screws at min. 6" spacing;
5. Extend plywood sheet min. 6" beyond edge of ventilation opening (all four sides); and,
6. Seal perimeter of plywood sheet and existing concrete vault wall with appropriate sealant to ensure weather tightness (all four sides).

In addition, Contractor is required to ensure sufficient air flow is provided to existing underground vault/electrical equipment at all times. Existing ventilation openings (one per vault) shall not be plugged until new ventilated manhole covers per C-5000/C-5001 are installed. The new ventilated manhole covers must be protected from damage and/or soiling from concreting activities of the adjacent stem wall. The existing ventilation openings must be plugged prior to start of BSE activities to restrict entry of water and/or construction debris into the existing underground vault/transformer spaces.

T-0045	301 Mission Screen Wall - Void Below Existing Embed	Closed	03/02/2011	03/12/2011	03/17/2011	Potentially	☐

From: Webcor Construction LP — David Hungerford
To: Turner Construction Company — Daphne Faulkner
Answered By: URS Corporation — David Fyfe
Co-Author:

REQUEST:

Reference: Attached pictures

The new 301 Mission screen wall location is to be laid out over an existing embed plate. At that plate #8 rebars are to be epoxied per RFI T-0027. Currently in the field the embed has been cut where the dowels are to be installed and holes are being drilled to the required 30" depth. It has been discovered that there are voids below the exitsing embed plate of up to 1.5". See attached pictures for some locations where this condition occurs. Please advise if this void is to be filled.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Voids below the existing embed plate shall be filled by use of grouting applied by use of low pressure grouting methods to deliver grout into void spaces. The result following grouting shall be that all voids are fully grouted. All grout materials shall be non-shrink grout. Pressure grouting shall be performed by qualified personnel who have experience in low pressure grouting steel plates. Contractor shall submit qualifications in the form of resumes identifying project experience utilizing low pressure grouting for personnel performing the work.

The Contractor shall provide a submittal identifying the non-shrink grout mix proposed for use and a narrative providing a full description of the means and methods proposed to result in grout flow from input point to output point including methods to result in prevention of trapped air (air is to be displaced by grout flow). A narrative describing means and methods shall specifically include identification of proposed equipment and the proposed porting and venting to allow installation of non-shrink grout and displacement of trapped air.

Where the embedded plate is not continuous (where the plate is not provided), the existing concrete surface shall be prepared meeting all requirements of a bonded construction joint.

REQUEST:

Reference CR T-005B

As BBII has explained at the TG03 Trade Subcontractor - Design Team Coordination Meeting No. 3, held on February 23, 2011, in order for BBII to provide meaningful pricing and make preparations to order materials that will be required for the changed work, BBII is respectfully requesting revised contract documents for all work that is impacted by this change, specifically including, but not limited to, geotechnical and demolition drawings.

These drawings will allow BBII to accurately identify the changes and provide pricing that complies with Section 6 of the General Conditions.

In addition, due to increasing steel prices and long lead times, BBII proposes a revision to CR T-005B to allow for the ordering of additional shoring wall beams prior to the rest of the Change Order being negotiated. BBII believes this will reduce the overall cost of this change. Upon receipt of the revised drawings that include the new shoring wall beam table (GT-5101), BBII will be able to receive quotes for this work and finalize an order.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

URS will issue a revised D-2200 drawing this week.

03/10/2011 - George Metzger

Some parts of the question need to be answered by URS/PMPC/TJPA/Turner.

ARUP Response:

Arup's response regarding the request for geotechnical drawings and the soldier pile schedule is as follows: the "CDSM Shoring Wall Schedule" on GT-5101 does not change. The wall segments shown on the plan were simply extended to include the increased wall length. It is possible that the top of wall elevation may change +/- 1 ft once the finish grade is established following demolition of the buildings. The length of the soldier pile and the depth of the drilled hole from the ground surface will not change from that shown on the schedule.

In addition to GT-2101 which was issued as SKGT-0001-R1 in response to RFI-017, the change order will include the following drawings: GT-0000 (the drawing index will be clouded to show the affected drawings); GT-0100, GT-1110, GT-2000 (the shoring wall layout

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

will be revised as shown and detailed on SKGT-0001-R1); and GT-5105 (the sections at 564 and 568 Howard will be deleted as these buildings will be demolished; a section will be added at 580 Howard showing the approximate distance to the building corner). Aside from the changes to GT-2101 which have been issued as SKGT-0001-R1, We consider the above described drawing changes to have no cost impact and therefor have not yet been issued.

Answered By: Adamson Associates, Inc. George Metzger

Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

Reference Sheet GT-1110, RFI #T-0018, and attached photos and drawings

Previous RFI #T-0018 - BSE - Waler to CDSM Wall spacing addressed BBI's concern with only having 6" clear between the face of the CDSM Wall and the Waler. Conversations in the weekly TG03 BSE Design Team Coordination meetings have re-raised the issue and BBI believes it requires additional consideration. The response in RFI #T-0018 said that rebar couplers in the wall verticals (in the next contract) would be used to eliminate the conflict. BBI believes that this seems to be impractical and not cost effective for over 3000 lf feet of wall and 4 levels of walers. Providing a standoff equal to the wall thickness would be an additional cost to the BSE contract, but BBI believes it would be minor compared to dealing with the cost to deal with the conflict later.

BBI is requesting to please re-evaluate and provide direction.

Attached is a suggested detail as well as examples where it has been used before, for your consideration.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ARUP Response:

Provided the criteria shown in the Contact Documents is satisfied, the proposal is acceptable.

Additionally:

Provided this proposal is acceptable to the TJPA, the internal bracing design submittal shall include the details and calculations associated with this proposal.

The soldier piles shall be checked for the increased moment due to the eccentric strut reaction. This check shall be reported in the internal bracing submittal.

No increase in torsional loading on the soldier pile is permitted.

End of Comments

BBI is requesting to please re-evaluate and provide direction.

Attached is a suggested detail as well as examples where it has been used before, for your consideration.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

REVISED RESPONSE TO RFI #T-0053

TJPA revises response to as follows:

The W/O and BBI proposal to increase the spacing between the waler and CDSM wall is acceptable to TJPA since it meets the requirements in 31 55 00 1.5 DESIGN subsections I, J, K, L, and M. This design is for Contractor use. This proposal from the Contractor creates multiple benefits for W/O and BBI including
The waler is out of the way of the rebar and this will help W/O with their coordination with the Train Box concrete work subcontractor.
W/O benefits since more rebar can be installed with this increased spacing which saves time to the schedule and costs associated with the waterproofing and rebar installations.
BB benefits because it appears that there is a decrease to the number of times that struts and walers must be moved.
BB benefits in that strut length remains essentially the same when restrutting after Train Box wall sections are completed.

TJPA and the Program Management Team suggest that W/O and BB proceed with a 3' - 6" spacing or whatever dimension is necessary to insure that the walers are not within the Train Box Wall profile. If the walers position requires rework, the Contractor and SubContractor take full responsibility to meet design requirements with no change to contract cost.
TJPA agrees to this suggestion from the Contractor to offset the waler from the CDSM wall to allow for the construction of the Train Box wall. TJPA requests that the Contractor proceed on this issue as a no-cost resolution to these RFIs. If W/O finds that this Internal Bracing for Shoring Wall design does have an additional cost to TJPA, the funds will come from the CM/GC Contingency Fund.

BBI is requesting to please re-evaluate and provide direction.

Attached is a suggested detail as well as examples where it has been used before, for your consideration.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

TJPA and Program Management Team expect that the Contractor and Sub-Contractor meet the design requirements for the Design/Build of the Internal Bracing as specified in 31 55 00 INTERNAL BRACING FOR SHORING WALL and per the Contract Drawings. As subsection 1.8 M. states,

"Walers are to be placed against the shoring wall on spacers to provide a minimum of 6 inches of clearance between the waler and the shoring wall. The 6 inch clearance is to provide a continuous path to allow the outboard curtain of reinforcement of the permanent wall to be routed through this space without requiring use of couplers or added lap splices at walers..."

The Submittal for Internal Bracing needs to address the concerns expressed by the reviewers including Arup in their response to RFI T-0053 which states:

"Provided the criteria shown in the Contact Documents is satisfied, the proposal is acceptable.

Additionally:

Provided this proposal is acceptable to the TJPA, the internal bracing design submittal shall include the details and calculations associated with this proposal.

The soldier piles shall be checked for the increased moment due to the eccentric strut reaction. This check shall be reported in the internal bracing submittal.

No increase in torsional loading on the soldier pile is permitted."

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

2" minimum asphalt concrete (AC) overlay not

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

attached material information

For the temporary bridges, BBII will be using the attached structural bridge deck material from Big R Bridge. The troughs are filled completely with AC to the top of the decking, and an overlay will be applied over the top. BBII would like to use a 2" minimum overlay, resulting in an overall cross section with an average 4" thickness. Bridge geometry requirements specified in section 01 53 13 - 1.3.A.6 will be met without reducing the overlay thickness below the 2" minimum.

Please confirm this is acceptable.

acceptable. Provide minimum of 4" asphalt concrete (AC) overlay per contract documents (specification section 01 53 13, 1.3.B.3).

To: Turner Construction Company Daphne Faulkner
Answered By: Turner Construction Comp Daphne Faulkner

REQUEST:

Reference CR T-006

The Change Request documents do not indicate who will have the maintenance responsibility for the AC walkway.

BBII has the following questions:
1. Should BBII include pricing for maintenance? If this walkway is going to get placed on top of the 3'' minus rubble, a fair amount of maintenance would be required.
2. When is this walkway scheduled to be constructed? And if maintenance is needed, when would it start?
3. Are the typical fence and K-rail shown in the section the same ones that are protecting the perimeter, or an additional row that creates a walkway that has both sides fenced, protecting the public from construction and vehicle traffic?

BBII needs to have this information in order to provide accurate pricing for this Change Request T-006. Please advise.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

This is not an RFI. W/O has control of the site and is to coordinate maintenance duration with their subcontractor for pricing.

REQUEST:

Reference RFI T-0056 and CR T-006

Please confirm that any necessary repairs of the AC overlay are excluded from CR T-006 scope as discussed at the TG03 BSE - Design Coordination Meeting on 3/23/2011. Also, please provided additional sketches we discussed at the meeting as well. Finally, please provide a complete copy of Demo Contractor¿s change order related to CR T-006 to fully understand the limits of their responsibility.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

CM/GC is responsible for maintenance of site - including these sidewalks- debris, cleaning, graffiti etc. as specified in contract documents.

The AC overlay was installed by Demolition Contractor per RFI 24.2. The basements were filled per contract using crushed concrete, compaction methods were used by EBi and verified by ISI Special Inspector. The AC overlay was installed per RFI 24.2 with asphalt applied no less than 3" thick.

However, the CM/GC's concern is related to the required repair if there is a failure of this asphalt. If there is a failure of the AC overlay (if caused by pedestrian traffic on this sidewalks- not construction

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

equipment), then this should be brought to the attention of TJPA Rep at that time in accord with contract.

Demo RFI 24.2, EBi Proposal drawings and Change Order attached.

T-0057 **BSE - Verticality and Sonic Testing on Drilled Piers and Shafts** **Closed** **03/10/2011** **03/20/2011** **03/11/2011** **Potentially** ☐

From: Webcor Construction LP Nhi Tran **To:** Turner Construction Company Daphne Faulkner **Answered By:** Adamson Associates, Inc. George Metzger

Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

Reference Sheet GT-5202 and Specification Section 31 63 29

Specification Section 31 63 29, 3.8.I.3 states "The contractor shall perform a test to determine verticality of the steel tubes, or drilled holes, that are going to be used for the sonic tests."

BBII has been advised by a number of testing firms that verticality tests cannot be performed on steel tubes or PVC tubes tied to steel cages. Detail 12 on Drawing GT-5202 shows 4 equally spaced PVC or steel tubes tied to reinforcing steel cage. BBII has also been informed that, as of now, there is not a specification in existence that mentions vertical tolerances of CSL tubes.

BBII is proposing to do the following in lieu of formally testing the CSL tubes for verticality:
1. BBII will make sure that the tubes are parallel and symmetrically placed. The cages and tubes will be properly inspected for positioning, spacing, parallelism prior to placing the cages into the hole. This is the most important inspection to ensure accurate CSL results.
2. Since the tubes are tied directly to a vertical cage, and the cages and casings are tested for verticality anyway, BBII will do a visual inspection to ensure that the tubes are sufficiently "vertical" for CSL testing purposes prior to placement of tremie concrete.
3. BBII will make sure that the cages are carefully lifted in a manner that limits the deflections of the cage to ensure

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ARUP Response:

The verticality of the holes / tubes must be checked to properly interpret the CSL test results. If verticality tests cannot be performed on steel tubes, consider using PVC tubes. The integrity of the PVC tubes can be maintained by filling them with water and inserting alignment bars into them prior to concrete pouring.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

that the CSL tubes do not fail at the joints.

Please confirm if this is acceptable.

T-0061	BSE - Concerns About Pile To Mat Slab Connection	Closed	03/15/2011	03/25/2011	03/23/2011	Potentially	☐

From: Webcor Construction LP Nhi Tran
To: Turner Construction Company Daphne Faulkner
Answered By: Adamson Associates, Inc. George Metzger
Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

Reference Sheet S-3003 and attached detail

BBII has concerns that the trestle pile to mat slab slip connection as shown in detail 2 on S-3003 will not work as intended. Based on BBII's understanding that this joint is intended to allow the mat slab to deflect upward and our limited knowledge of the permanent structure design, BBII has listed some concerns with this connection below:
1. BBII does not think the sleeve will be able to slide with the bolts and slotted holes completely encased in concrete. (see attached)
2. If the slab does deflect upwards and the lower section of pile is no longer in contact with the bearing plate, then the mat slab is carrying the entire load on the pile.
3. Any upward movements of the slab will affect the trestle supper structure framing. Differential upward deflections could cause damage depending on severity.

BBII does wish to bear the risk of re-designing this joint due to the interaction with the permanent structure, however BBII has attached a suggestion that they feel would eliminate some of their concerns listed above.

Please provide a revised detail or rebut BBII concerns if you still believe the detailed connection is the best suited for this application.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Thornton Tomasetti response:

Comments in response to BBII concerns:

1. Bolts/slotted holes could be isolated from the concrete via styrofoam blocks.

2. Anticipated slab movement upward is due to rise of groundwater pressure after the dewatering pumps are turned off - which is after structure is completed and trestle work is completed.

Comments regarding proposed alternate detail:

1. Proposed detail does not address waterproofing at bottom of mat and allows water infiltration into the mat as currently presented.

AAI Response: Alternate detail will not satisfy waterproofing requirements.

T-0062	BSE - Concrete Submittals	Closed	03/16/2011	03/26/2011	03/23/2011	Potentially	☐

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

REQUEST:

Reference photos (attached)

It appears that the demolition contractor is leaving large unprocessed rubble along the backside of some of the basement walls (See attached photos). Per the demolition drawings included in BBII's contract, all of the material in this area should be crushed/processed concrete at 3'' minus. Handling material that does not meet these requirements will be considered a changed condition. Please advise.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The site Parcel E is in progress. The basement will be filled in accord with the contract drawings with crushed/processed concrete at 3'' minus upon completion of work by the demolition contractor - contract completion date 4/7/11.

Please do not use RFI to ask a question of an area not yet completed by the Demolition contractor. Webcor-Obayashi the CM/GC or Turner Construction CMO can easily answer these questions over the telephone or via e-mail.

T-0065 **301 Mission Wall - Length of dowels in concrete wall** **Closed** **03/17/2011** **03/27/2011** **03/24/2011** **Potentially** ☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: Sheet S-5000, RFI T-0042

The response to RFI T-0042 specifies for the new concrete wall height to be exposed above the existing pavers a minimum 18". To achieve this requirement, the overall concrete wall height must be increased 8", therefore also increasing the length of the dowels that are to be installed.
The #8 embedment bars have already been purchased and fabricated. To achieve the higher wall height per response to RFI #T-0042, 90% of these fabricated #8 bars will have to be scrapped and new bars with the longer length must be made.
As an alternative, would it be acceptable to still use the fabricated #8 embedment bars dowelled 30" into the wall per RFI T-0027, with the lenton terminator which would be set 32" above the (E) steel plate?

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Use of fabricated #8 bars with lenton terminator acceptable. #8 embedment bars shall be dowelled 30" into existing concrete vault wall per RFI T-0027.

Resulting distance from top of #8 embedment bars with lenton terminator to top of new concrete wall will vary between approximately 3" - 9", verify in field. If resulting distance from top of #8 embedment bars with lenton terminator to top of new concrete wall is greater than 6", contractor shall install #4 U-bars at 12" on center. #4 U-bars shall be centered between the #4 ties on both sides of the #8 bar(s). #4 U-bar legs shall be 22" long.

See attached coordination sketch.

TJPA Representative to field verify all rebar placement prior to Contractor placing concrete.

REQUEST:

Reference RFI T-0047

Based on recent discussions, BBII is requesting confirmation of their understanding of Specification Section 01 15 40:

1. The inside survey of the adjacent buildings will be performed by ARUP and ARUP is in the process of performing these surveys. BBII will attend these surveys to the extent possible. ARUP will also provide monitoring of these buildings, including but not limited to, active crack monitoring. ARUP will make the initial survey and subsequent monitoring information available to BBII. BBII reserves its right to review this information and request to perform its own indoor survey at any of the surveyed buildings. ARUP is solely responsible for the accuracy of the information provided and the continuation of the monitoring effort. ARUP is also responsible for ensuring that the property owners concur with the surveying methods and the results.
2. The list of 19 buildings previously provided by BBII is accurate and is in conformance with ARUP's list.
3. The TJPA will arrange for a survey of the outside of these buildings with the attendance of the property owners. BBII will attend with its professional photographer as required by the Specifications.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

1. Correct.

2. The 19 buildings listed by ASC for BBI are all included in the pre-construction survey list prepared by Arup (copy attached).

(note the 101 1st Street address listed by ASC should be corrected to 100 1st & 533 Mission)

3. Correct.

T-0069 **BSE - Revised Shoring Wall Layout Clarification** **Closed** **03/23/2011** **04/02/2011** **03/28/2011** **Potentially** ☐

From: Webcor Construction LP Nhi Tran

To: Turner Construction Company Daphne Faulkner

Answered By: Adamson Associates, Inc. George Metzger

Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal

REQUEST:

BBII believes there is an issue with some of the information provided regarding the revised shoring wall layout.

The following information was provided on drawing SKGT-0001-R1:

- The (x, y) distances of the intersection of the LOL's of segments X1-1 and R2-1 (Point P on attached sketch) from the intersection of 1-line and J-line: (x, y) = (73'-2 1/4", 166'-4").
- The (x, y) distances of the radial center of segment R2-1 (Point C on attached sketch) from the intersection of 1-line and J-line: (x, y) = (490'-7 1/4", 640'-10 1/4").
 The radius of the LOL of segment R2-1 as 633'-6".

The distance between the point P and point C can be calculated with the above information:
 ΔX = 490'-7¼" minus 73'-2¼" = 417'-5" = 417.417
 ΔY = 640'-10¼" minus 166'-4" = 474'-6¼" = 474.521
 D = (ΔX2 + ΔY2)1/2 = (417.4172 + 474.5212)1/2 = 632.053'

Using the distances provided on SKGT-0001-R1 gives a distance of 632.053' between point P and C. This distance must be 633'-6" because it lies along segment R2-1 and the radius of the arc is given. There must be an error in

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ARUP Response:

The dimensions to the corner of the LOL where segment X1-1 and R2-1 meet have been revised.

See the attached SKGT-0001-R2.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed

either the radius or one of the other given dimensions.
BBII requests an expedited response as this information is critical to our work.

T-0070 **BSE - Excavation Permit for Pre-trenching in the Public Right of Way** **Closed** **03/24/2011** **04/04/2011** **03/25/2011** **Potentially** ☐

REQUEST:

Reference Specification Section 01 53 13

During a meeting with the San Francisco DBI & DPW, it was expressed that BBII must use response spectra generated by ARUP in the design of the temporary bridges. It was also noted that if the bridges are going to be in place for over 5 years, the design must be for a permanent structure and the specified ground motion may not be suitable. Therefore, BBII requests response spectra for a ground motion with a 10% probability of exceedence in 50 years as specified, as well as for a ground motion with a 7.5% probability of exceedence in 75 years.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ARUP Response:

This request needs to be discussed in more detail. We will provide this in time for Tuesday's meeting.

Adamson Comment:

The meeting referenced will be held on April 12, 2011. The purpose of delivering the information in the meeting is to confirm that the Contractor and Arup have a common understanding of the requested information and the data being transmitted.

Reference Response to RFI#T-0073

During a meeting with the San Francisco DBI & DPW, it was expressed that BBII must use response spectra generated by ARUP in the design of the temporary bridges. It was also noted that if the bridges are going to be in place for over 5 years, the design must be for a permanent structure and the specified ground motion may not be suitable. Therefore, BBII requests response spectra for a ground motion with a 10% probability of exceedence in 50 years as specified, as well as for a ground motion with a 7.5% probability of exceedence in 75 years.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ARUP Response:

Attached are:

1. Arup Amec (2010) report Tables 3-3(bedrock), 3-7a (base of structure West end of box), 3-7b (base of structure East end of box), 3-9 (ratio vertical to horizontal spectral acceleration ratios) and Table 3-4 giving scale factors for near-fault effects. Note that these spectra exclude structural interaction effects and do not include the progressive softening effects that will occur progressively in the Old Bay Clay.

2. Output from LS Dyna dynamic analyses of the temporary (1 in 100 year return period) condition at 301 Mission, adjacent Fremont Street abutment, using the Kobe bedrock and far-field motions to generate the horizontal acceleration spectrum at the top of the shoring wall. This produces increased spectral accelerations at the fundamental period (understood to be 0.8s) of the Contractor's bridge structure.

Arup recommends that a meeting be held to review and discuss these after the Contractor's engineer has examined them.

T-0074	301 Mission Wall - Nelson Stud and Stirrup Locations	Closed	04/01/2011	04/11/2011	04/01/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

Co-Author:

REQUEST:

Reference: RFI T-0027

Per field conversation, please confirm that it is acceptable to install/weld nelson studs at 9" on center at locations in front of the vault intrusions into the concrete stem wall, where the #8 size dowels are also spaced at 9" on center, per RFI T-0027. The Nelson Stud spacing will match dowel embeddment locations. This spacing also facilitates the installation of rebar stirrups and provides two tie points, one being the dowel, and the other the nelson stud.

This work is currently ongoing and immediate confirmation is requested. Please confirm this layout is acceptable.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Industry standard practice is to use miscellaneous added tie rebar (e.g. #3 or #4 bar) to provide for requirements to tie reinforcement bars as required. This RFI is a request to change spacing of nelson stud bars from 12" o.c. to 9" o.c. (where #8 dowels are spaced at 9" o.c.) in lieu of use of added tie bars.

We note this request is for convenience of the Contractor and on this basis take no exception to reducing the spacing of the nelson stud bars from 12" o.c. to 9" o.c. (where #8 dowels are spaced at 9" o.c.). Accordingly, no change in contract and/or extension in schedule will be provided to accommodate this Contractor request. All impacts including cost and schedule associated with reducing spacing of nelson stud bars shall be borne solely by the Contractor.

David Fyfe, 04/01/2011

No CR will be issued for work associated with the change in nelson stud spacing from 12" o.c. to 9" o.c. (where #8 dowels are spaced at 9" o.c.).

REQUEST:

Reference Sheet D-1072, D-1030, D-1046, and D-5103 and Spec Section 01 35 65

Please advise the following as discussed with BBII on 03-28-2011 have been completed per the Demolition Contract:
- Bent 59-61 - Removal of columns, footings and timber piles as required to complete 4'x4' x13' excavation below grade complete and backfilled. (Refer to drawings D-1072, D-1030, D-1046).

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Demolition of both Bent 59 and 61 was completed per Demolition Contract Drawing D-1046 Rev.0 Dated 01/04/10 and Drawing CL-17456 Rev.1 dated 8/10/09.

Bent footings were demolished to the minimum 3 feet below grade per drawing D-1046 and applicable notes. Locations of these Utility Pole Foundations were determined by SFMTA (MUNI) and BLHP (Street Lighting).

The three (3) locations total for the new Utility Pole Foundations had the bent footings removed and were excavated to a depth of 13' (+/-). Wood piles were not "pulled." Pile removal consisted of removing the top of pile as required to install the pole foundations to depth.

REQUEST:

Reference Demo Contract Drawings

Per note 5 on drawing D-1006 of the demolition contract, each discreet fenced area shall have a minimum of two 16ft gates at the conclusion of demolition work. Currently, zone 4 only has one gate in place. BBII requests an additional gate be provided on the Fremont St. side of zone 4. BBII is available to meet and coordinate an ideal location.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Demolition Contractor second 16 foot gate eliminated due to Fremont Shoring wall. Demolition contractor used alternate means and methods for truck traffic to-from parcel D Zone 4.

That said, Demolition contractor has offered gate credit which could be used to install a 16 wide gate either at SW corner near 181 Fremont St. or on the Beale St. fence line. However- Demolition contractor would not be responsible for curb cut, removal of parking meters or other ancillary scope if Beale St. gate is chosen - that would be the responsibility of BSE Contractor. BBII can use/modify and relocate barrier fence and gates as needed per your contract. A field coordination meeting after the Monday 4/11/11 Street Coordination meeting is recommended.

Answer The contractor may relocate the entire buttress structure up to 12 inches east of the design location in order to clear any conflict with the Fremont Street shoring wall. Contractor is requested to identify the new layout and any impacts prior to start of buttress construction.

REQUEST:

The response for RFI #T-0088.1 was not an acceptable answer to the question.

Please provide exact revised layout as required.

The Buttresses have exact Coordinate Locations to define the layout, as shown on GT-2201.

The existing coordinates must be changed to reflect the new layout the TJPA desires.

Information from RFI#T-0088

Reference Sheet GT-2201 and Specification Section 31 63 29

The temporary shoring wall installed under the demolition contract was moved East away from Fremont St. to avoid an unknown existing concrete wall. The as-built alignment of the wall now falls along the edge of the third column (C) of buttress shafts. In an effort to avoid conflicts with column C shafts generated by the revised temporary shoring wall alignment, BBII suggests that the buttress formation be moved 12'' East.

REQUEST:

Reference response to RFI T-0096 and Specification Section 02 41 01

BBII interprets the Response to RFI T-0096 (BBI 0067) as TJPA's approval for the removal of this unforeseen structure. Please confirm.

BBII proposes to follow the method outlined below for the removal of this unforeseen structure. Please confirm in writing that the removal of this unforeseen structure is approved and that provided that it is performed with the method outlined below, no damage to adjacent buildings will occur.

Pre Trench Obstruction Removal Method

Location:
Parallel along the 301 Mission St. Low Rise (Grid line A, approximately between lines 29 & 34).

Obstructions:
The footing consists of bricks and concrete. It also has a perpendicular footing that comes out from the footing that is parallel to the 301 Mission building wall.

Method:
BBII will first expose the obstructions and use an excavator mounted and hand held jackhammer to demolish the large masses into smaller more manageable sizes. An excavator with a bucket will then clear the debris, until the debris is removed from the area of the CDSM Wall location. BBII will chase the obstruction as deep as it goes in order to remove all debris necessary for a clean location to construct the CDSM Wall. Due to the unknown depth of the obstruction, at BBII discretion Sheet Piles or trench boxes may be used to support trench walls. All OSHA approved, safe practices will be used by BBII employees during the Demolition.

Additional Details:
As noted in the RFI response, the Archeologist has already examined the site. BBII (W/O) will notify the TJPA if additional structures or items are encountered.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Construction means and methods are the contractor's responsibility exclusively. RFI response are not authorization of any change in contract sum or contract time.

We take no exception to above method for the removal of structure. This work will be tracked in accord with CR T-0010.

REQUEST:

Reference attached photos

BBII has encountered a drainage material along the 301 Mission wall while pretrenching. During pretrenching, this drainage material has been removed because it was not affixed to the structure. The wall does not have any exterior waterproofing system.

Upon installation of the CDSM shoring system, the cementious material will be against this wall. The existing wall is a 5' deep cantilevered beam on the backside of the existing garage shaft for 301 Mission. Does TJPA plan to install any waterproofing along this wall that can tolerate the installation of a CDSM shoring system?

Please advise BBII of the TJPA's plan for waterproofing of this building.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Drainage material encountered is to be removed from the 301 Mission Wall as it was a temporary measure installed at the time of 301 Mission building construction. No waterproofing is required at this location. See attached email response from R. Rothenburger at PMPC.

04/19/2011 - George Metzger

REQUEST:

Reference Drawings U-0100 and GT-0100

BBII's surveyor, KCA Engineers, has noticed some slight variations in bearings between the Utility drawings and the BSE drawings. Please see the following of KCA's observations and confirm coordinates provided on drawing GT-0100.

Drawings U-0100 has coordinates along the center lines of various streets. The result of those coordinates put a bearing on the center line of Mission Street and Minna Street at North 46° 18 ' 19.6" East and the center line of First Street at North 43° 41 ' 39.0" West. This results in those streets not being at right angles to each other.

Drawings GT-0100 has coordinates on Column Line E. The result of those coordinates puts a bearing of North 46° 18' 09.7" East on the terminal Tills is 00° 00' 10" off from being parallel with Mission and Minna Streets.
Is this correct or should Column Line E be parallel with Mission and Minna Streets?

The numerical column lines are shown at right angles to Column Line E, which gives them a bearing of North 43° 41 ' 50.3" West. It was observed that Column Line 18 appeared to be in almost the same location as the center line of First Street, but First Street has a bearing of North 43° 41 ' 39.0" West which is 00° 00' 11" different than Column Line 18. Is it just a coincidence that the center line and column line are almost exactly in the same location or should something be adjusted to make the two lines identical?

Please advise if the bearings of the terminal should remain or be changed.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

ARUP Response: The Building Grid and bearing has been established to best-fit the numerous constraints on the project. It is coincidental that the street control lines (note, these are not necessarily in the center of the Right-of-Way and should not be construed as Center Lines) are very close, but at slightly different bearings. The building elements are constructed based on the building grid, whereas the utilities and subsequent street level improvements will be constructed based on the street control lines. The Numerical Bearings of the North South Grid lines appear to be correct. A follow-up survey control meeting should take place to ensure the shoring wall layout is performed as intended.

Pre Trench Obstruction Removal Method

Location:
Parallel along the 177/181 Fremont Street (Grid line J, approximately between lines 26.5-30).

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Construction means and methods are the contractor's responsibility exclusively. RFI response are not authorization of any change in contract sum or contract time.

We take no exception to above method for the removal of structure. This work will be tracked in accord with CR T-0010.

Obstructions:
A large concrete structure.

Method:
BBII will first expose the obstructions and use an excavator mounted and hand held jackhammer to demolish the large masses into smaller more manageable sizes. An excavator with a bucket will then clear the debris, until the debris is removed from the area of the CDSM Wall location. BBII will chase the obstruction as deep as it goes in order to remove all debris necessary for a clean location to construct the CDSM Wall. Due to the unknown depth of the obstruction, at BBII discretion Sheet Piles or trench boxes may be used to support trench walls. All OSHA approved, safe practices will be used by BBII employees during the Demolition.

Additional Details:
As noted in the RFI response, the Archeologist has already examined the site. BBII (W/O) will notify the TJPA if additional structures or items are encountered.

Reference Specification 01 13 50 and 00 03 35

The Site Mitigation Plan in Spec section 01 13 50 of Volume 1, References the report "PSI for Caltrans, 1999." After looking through the contract documents for the Analytical back-up, BBII, Treadwell & Rollo, and Republic Services, have not been able to find it. It is necessary to have this information to properly dispose of the Hazardous Materials.
To Complete the Profile of the work site, the Disposal facility, Republic Services, BBII need the Lab Data/Analytical Data from the report.
At this time, the lack of information is halting the process of Material Off-Haul.
Please Advise, or supply the Needed Report Information.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Caltrans' Site Investigation Report for SFOBB West Approach, prepared by PSI in 1999 can be assessed from Constructware or from ftp site as below:

ftp://ftp.tjpa.org/Document%20Control/1104168/

Log In Instructions

1. Enter case-sensitive Username (public) and Password (PublicFTP1)

2. Select View\Open FTP Site in Windows Explorer

3. Drag file(s) to your desktop

REQUEST:

Reference attached sketches and Sheet S1-3201

Drawing S1-3201 provides information on beam sizing in the permanent concrete structure. BBII was recently provided additional structure sections in response to T-0035.1, and a number of the beams appear to have changed in size. Beams at gridlines 18, 26, 34, & 35 should be 5' wide according to schedule A on drawing S1-3201. However, from the section provided at gridline A, these all appear to be sized at 7' wide. The sizes of these beams are critical in determining the final geometry and location of our temporary bridges. BBII acknowledges that the structural drawings are not to be scaled, so please advise if these beams are to be 60" wide as indicated in schedule A, or if they have increased in size to 84" wide.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

Thornton Tomasetti Reply:

The concrete beams at gridlines 18, 26, 34, & 35 at Ground Level have increased to 84" wide. The design is "in-progress".

T-0106	301 Mission Wall - Connection from Metal Stud to Tube Steel	Closed	04/20/2011	04/30/2011	04/27/2011	Potentially	☐

From: Webcor Construction LP David Hungerford **To:** Turner Construction Company Daphne Faulkner **Answered By:** URS Corporation David Fyfe

REQUEST:

Reference: E & C/S-5000

Please see E & C/S-5000. Transworld has attempted in their shop to set #10 SMS through the structural tube steel, as per plan. The attempt was unsuccessful, therefore Transworld tried the use of a Hilti X-U fastener into the structural steel. Attached are Hilti spec sheets for the X-U Universal Knurled Shank Fastener as well as a photo showing the X-U fastener through the structural steel. Welding is another option for connection to the tube steel. Please advise how Transworld is to fasten the metal stud to the structural tube steel.

SUGGESTION:

ANSWER: **Accept Suggestion:** ☐

The proposed Hilti X-U fasteners are for interior use only and are not acceptable for use on the 301 Mission exterior screen wall. Welding will damage the structural steel paint and light gauge steel galvanized coating and is not an acceptable means of connection.

To fasten metal stud to structural tube steel contractor may: 1) Use shot pins rated for exterior use (i.e. Hilti X-CR fastener - ESR 1663); or 2) Pre-drill holes and tap stainless steel machine screws.

CPM Activity Impacted - Buttress Wall

Below are three cases (A, B, and C) in which formally testing for verticality on CSL tubes, BBII argues would prove to be highly unusual and counter-productive:
